## Description

The Hitachi HM628512BI is a 4-Mbit static RAM organized 512-kword  $\times$  8-bit. HM628512BI Series has realized higher density, higher performance and low power consumption by employing Hi-CMOS process technology. The HM628512BI Series offers low power standby power dissipation; therefore, it is suitable for battery backup systems. It has packaged in 32-pin SOP, 32-pin TSOP II and 32-pin DIP.

## Features

- Single 5 V supply
- Access time: 70/85 ns (max)
- Power dissipation
  - Active: 50 mW/MHz (typ)
  - Standby: 10  $\mu$ W (typ)
- Completely static memory. No clock or timing strobe required
- Equal access and cycle times
- Common data input and output: Three state output
- Directly TTL compatible: All inputs and outputs
- Battery backup operation
- Operating temperature:  $-40$  to  $+85^{\circ}\text{C}$

---

### Pin Arrangement

### Pin Description

| Pin name        | Function          |
|-----------------|-------------------|
| A0 to A18       | Address input     |
| I/O0 to I/O7    | Data input/output |
| $\overline{CS}$ | Chip select       |
| $\overline{OE}$ | Output enable     |
| $\overline{WE}$ | Write enable      |
| V <sub>CC</sub> | Power supply      |
| V <sub>SS</sub> | Ground            |

# HM628512BI Series

## Block Diagram

**Function Table**

| $\overline{WE}$ | $\overline{CS}$ | $\overline{OE}$ | Mode           | $V_{CC}$ current  | Dout pin | Ref. cycle      |
|-----------------|-----------------|-----------------|----------------|-------------------|----------|-----------------|
| ×               | H               | ×               | Not selected   | $I_{SB}, I_{SB1}$ | High-Z   | —               |
| H               | L               | H               | Output disable | $I_{CC}$          | High-Z   | —               |
| H               | L               | L               | Read           | $I_{CC}$          | Dout     | Read cycle      |
| L               | L               | H               | Write          | $I_{CC}$          | Din      | Write cycle (1) |
| L               | L               | L               | Write          | $I_{CC}$          | Din      | Write cycle (2) |

Note: ×: H or L

**Absolute Maximum Ratings**

| Parameter                               | Symbol     | Value  | Unit |
|---|------------|--|------|
| Power supply voltage                    | $V_{CC}$   | −0.5 to +7.0                                       | V    |
| Voltage on any pin relative to $V_{SS}$ | $V_T$      | −0.5 <sup>*1</sup> to $V_{CC} + 0.3$ <sup>*2</sup> | V    |
| Power dissipation                       | $P_T$      | 1.0  | W    |
| Operating temperature                   | $T_{opr}$  | −40 to +85   | °C   |
| Storage temperature                     | $T_{stg}$  | −55 to +125  | °C   |
| Storage temperature under bias          | $T_{bias}$ | −40 to +85   | °C   |

Notes: 1. −3.0 V for pulse half-width ≤ 30 ns  
 2. Maximum voltage is 7.0 V

**Recommended DC Operating Conditions ( $T_a = -40$  to +85°C)**

| Parameter          | Symbol   | Min                | Typ | Max            | Unit |
|--------------------|----------|--------------------|-----|----------------|------|
| Supply voltage     | $V_{CC}$ | 4.5                | 5.0 | 5.5            | V    |
|                    | $V_{SS}$ | 0                  | 0   | 0              | V    |
| Input high voltage | $V_{IH}$ | 2.4                | —   | $V_{CC} + 0.3$ | V    |
| Input low voltage  | $V_{IL}$ | −0.3 <sup>*1</sup> | —   | 0.6            | V    |

Note: 1. −3.0 V for pulse half-width ≤ 30 ns

| Write cycle time                    | $t_{WC}$  | 70         | —   | 85  | —   | ns   |         |
| Chip selection to end of write      | $t_{CW}$  | 60         | —   | 75  | —   | ns   | 4       |
| Address setup time                  | $t_{AS}$  | 0          | —   | 0   | —   | ns   | 5       |
| Address valid to end of write       | $t_{AW}$  | 60         | —   | 75  | —   | ns   |         |
| Write pulse width                   | $t_{WP}$  | 50         | —   | 55  | —   | ns   | 3, 12   |
| Write recovery time                 | $t_{WR}$  | 0          | —   | 0   | —   | ns   | 6       |
| $\overline{WE}$ to output in high-Z | $t_{WHZ}$ | 0          | 25  | 0   | 30  | ns   | 1, 2, 7 |
| Data to write time overlap          | $t_{DW}$  | 30         | —   | 35  | —   | ns   |         |
| Data hold from write time           | $t_{DH}$  | 0          | —   | 0   | —   | ns   |         |
| Output active from output in high-Z | $t_{OW}$  | 5          | —   | 5   | —   | ns   | 2       |
| Output disable to output in high-Z  | $t_{OHZ}$ | 0          | 25  | 0   | 30  | ns   | 1, 2, 7 |

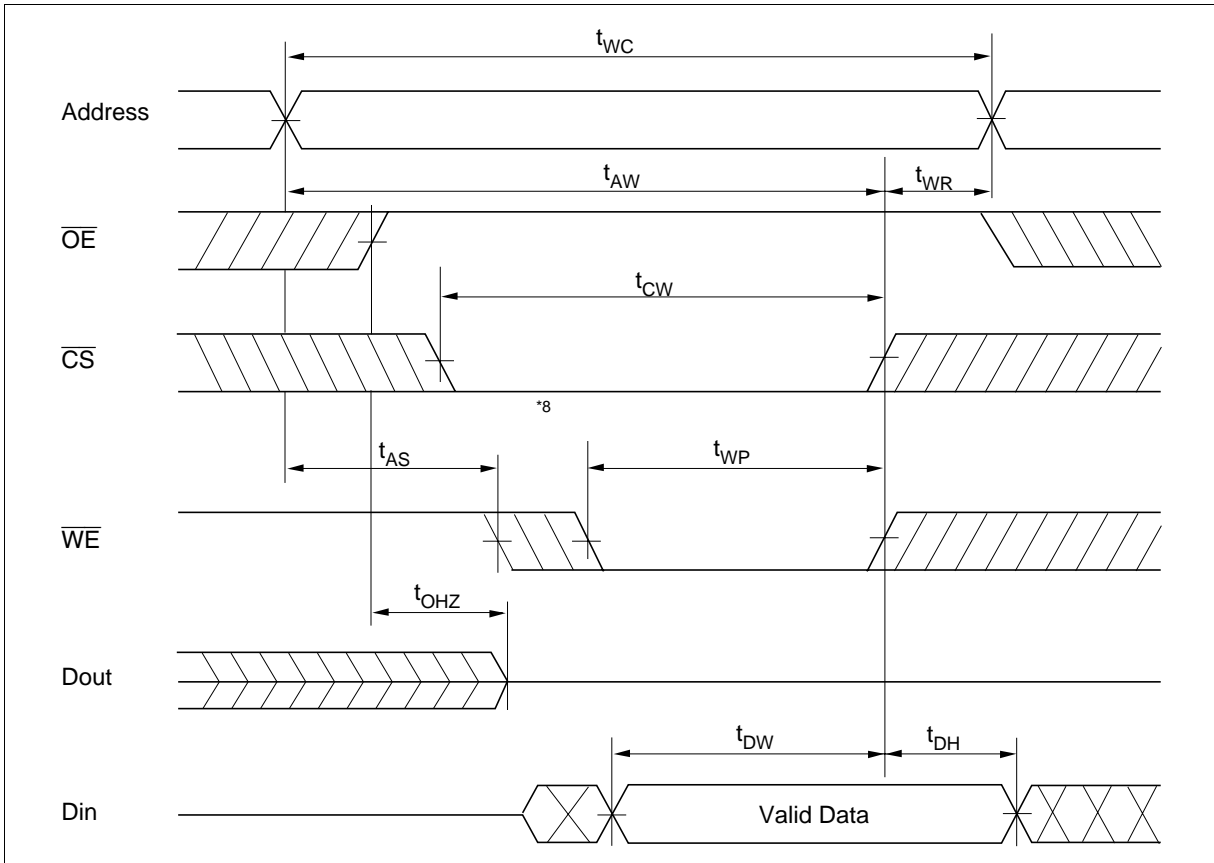

- Notes:
- $t_{HZ}$ ,  $t_{OHZ}$  and  $t_{WHZ}$  are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.
  - This parameter is sampled and not 100% tested.
  - A write occurs during the overlap ( $t_{WP}$ ) of a low  $\overline{CS}$  and a low  $\overline{WE}$ . A write begins at the later transition of  $\overline{CS}$  going low or  $\overline{WE}$  going low. A write ends at the earlier transition of  $\overline{CS}$  going high or  $\overline{WE}$  going high.  $t_{WP}$  is measured from the beginning of write to the end of write.
  - $t_{CW}$  is measured from  $\overline{CS}$  going low to the end of write.
  - $t_{AS}$  is measured from the address valid to the beginning of write.
  - $t_{WR}$  is measured from the earlier of  $\overline{WE}$  or  $\overline{CS}$  going high to the end of write cycle.
  - During this period, I/O pins are in the output state so that the input signals of the opposite phase to the outputs must not be applied.
  - If the  $\overline{CS}$  low transition occurs simultaneously with the  $\overline{WE}$  low transition or after the  $\overline{WE}$  transition, the output remain in a high impedance state.
  - Dout is the same phase of the write data of this write cycle.
  - Dout is the read data of next address.
  - If  $\overline{CS}$  is low during this period, I/O pins are in the output state. Therefore, the input signals of the opposite phase to the outputs must not be applied to them.
  - In the write cycle with  $\overline{OE}$  low fixed,  $t_{WP}$  must satisfy the following equation to avoid a problem of data bus contention.  $t_{WP} \geq t_{DW} \text{ min} + t_{WHZ} \text{ max}$

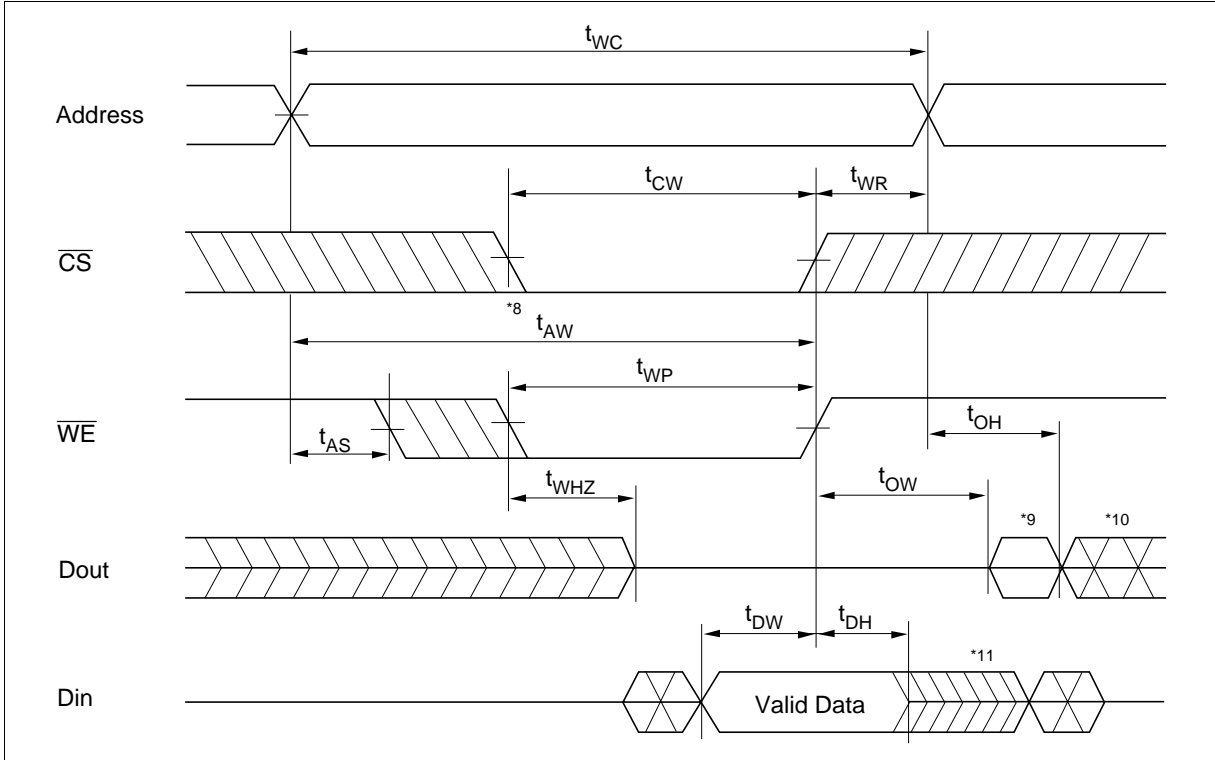

**Timing Waveforms****Read Timing Waveform ( $\overline{WE} = V_{IH}$ )**
