ADS8383

SLAS005B – DECEMBER 2002 – REVISED MAY 2003

18-BIT, 500-kHz, UNIPOLAR INPUT, MICROPOWER SAMPLING ANALOG-TO-DIGITAL CONVERTER WITH PARALLEL INTERFACE

FEATURES

- 500-kHz Sample Rate
- 18-Bit NMC Ensured Over Temperature
- Zero Latency
- Low Power: 110 mW at 500 kHz
- Unipolar Input Range
- Onboard Reference Buffer
- High-Speed Parallel Interface
- Wide Digital Supply
- 8-/16-/18-Bit Bus Transfer
- 48-Pin TQFP Package

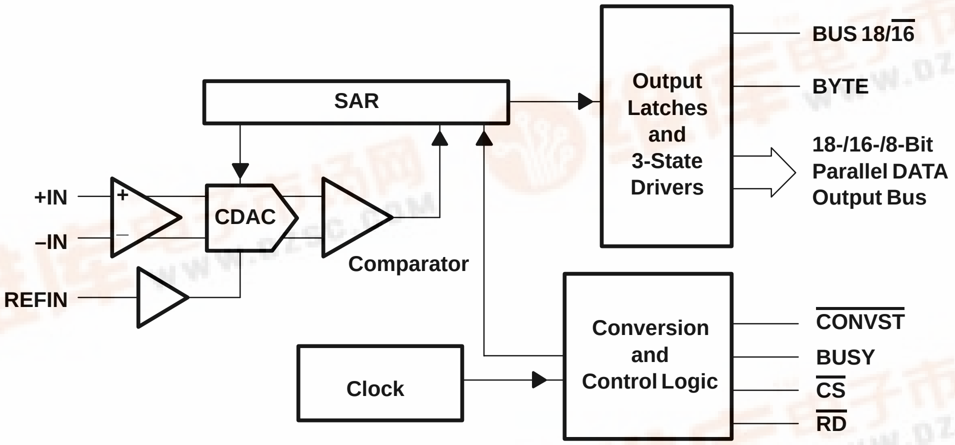
APPLICATIONS

- Medical Instruments
- Optical Networking
- Transducer Interface
- High Accuracy Data Acquisition Systems
- Magnetometers

DESCRIPTION

The ADS8383 is an 18-bit, 500 kHz A/D converter. The device includes a 18-bit capacitor-based SAR A/D converter with inherent sample and hold. The ADS8383 offers a full 18-bit interface, a 16-bit option where data is read using two read cycles or an 8-bit bus option using three read cycles.

The ADS8383 is available in a 48-lead TQFP package and is characterized over the industrial –40°C to 85°C temperature range.



These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

MODEL	MAXIMUM INTEGRAL LINEARITY (LSB)	MAXIMUM DIFFERENTIAL LINEARITY (LSB)	NO MISSING CODES RESOLUTION (BIT)	PACKAGE TYPE	PACKAGE DESIGNATOR	TEMPERATURE RANGE	ORDERING INFORMATION	TRANSPORT MEDIA QUANTITY
ADS8383I	±10	–2~7	17	48 Pin TQFP	PFB	–40°C to 85°C	ADS8383IPFBT	Tape and reel 250
							ADS8383IPFBR	Tape and reel 1000
ADS8383IB	±7	–1~2.5	18	48 Pin TQFP	PFB	–40°C to 85°C	ADS8383IBPFBT	Tape and reel 250
							ADS8383IBPFBR	Tape and reel 1000

NOTE: For the most current specifications and package information, refer to our website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted(1)

			UNIT
Voltage	+IN to AGND		+VA + 0.1 V
	–IN to AGND		0.5 V
Voltage range	+VA to AGND		–0.3 V to 7 V
	+VBD to BDGND		–0.3 V to 7 V
	+VA to +VBD		–0.3 V to 2.5 V
Digital input voltage to BDGND			–0.3 V to +VBD + 0.3 V
Digital output voltage to BDGND			–0.3 V to +VBD + 0.3 V
Operating free-air temperature range, T_A			–40°C to 85°C
Storage temperature range, T_{stg}			–65°C to 150°C
Junction temperature (T_J max)			150°C
TQFP package	Power dissipation		$(T_J\text{Max} - T_A)/\theta_{JA}$
	θ_{JA} thermal impedance		86°C/W
Lead temperature, soldering		Vapor phase (60 sec)	215°C
		Infrared (15 sec)	220°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

SPECIFICATIONS

T_A = –40°C to 85°C, +VA = 5 V, +VBD = 3 V or 5 V, V_{ref} = 4.096 V, f_{SAMPLE} = 500 kHz (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Analog Input						
Full-scale input voltage (see Note 1)		+IN – –IN	0		V_{ref}	V
Absolute input voltage		+IN	–0.2		V_{ref} + 0.2	V
		–IN	–0.2		0.2	
Input capacitance				45		pF
Input leakage current				1		nA
System Performance						
Resolution				18		Bits

Bias input range			2	2.048	2.1	V
Bias input drift					±5	%FS
Bias input current, sink			–150	–100		µA

(1) Calculated on the first nine harmonics of the input frequency
(2) Can vary ±20%

SPECIFICATIONS (CONTINUED)

T_A = –40°C to 85°C, +VA = +5 V, +VBD = 3 V or 5 V, V_{ref} = 4.096 V, f_{SAMPLE} = 500 kHz (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital Input/Output						
Logic family				CMOS		
Logic level	V_{IH}	I_{IH} = 5 µA	+VBD–1		$+V_{BD}$ + 0.3	V
	V_{IL}	I_{IL} = 5 µA	–0.3		0.8	
	V_{OH}	I_{OH} = 2 TTL loads	$+V_{BD}$ – 0.6			
	V_{OL}	I_{OL} = 2 TTL loads			0.4	
Data format				Straight Binary		
Power Supply Requirements						
Power supply voltage	+VBD (see Notes 1 and 2)		2.95	3.3	5.25	V
	+VA (see Note 2)		4.75	5	5.25	V
Supply current, 500-kHz sample rate (see Note 3)				22	26	mA
Power dissipation, 500-kHz sample rate (see Note 3)				110	130	mW
Temperature Range						
Operating free-air			–40		85	°C

(1) The difference between +VA and +VBD should be no less than 2.3 V, i.e. if +VA is 5.5 V, +VBD should be at least 2.95 V.

(2) +VBD ≥ +VA – 2.3 V

(3) This includes only +VA current. +VBD current is typical 1 mA with 5 pF load capacitance on all output pins.

TIMING CHARACTERISTICS

All specifications typical at –40°C to 85°C, +VA = +VBD = 5 V (see Notes 1, 2, and 3)

PARAMETER		MIN	TYP	MAX	UNIT

APPLICATION INFORMATION

MICROCONTROLLER INTERFACING

ADS8383 to 8-Bit Microcontroller Interface

Figure 37 shows a parallel interface between the ADS8383 and a typical microcontroller using the 8-bit data bus.

The BUSY signal is used as a falling-edge interrupt to the microprocessor.

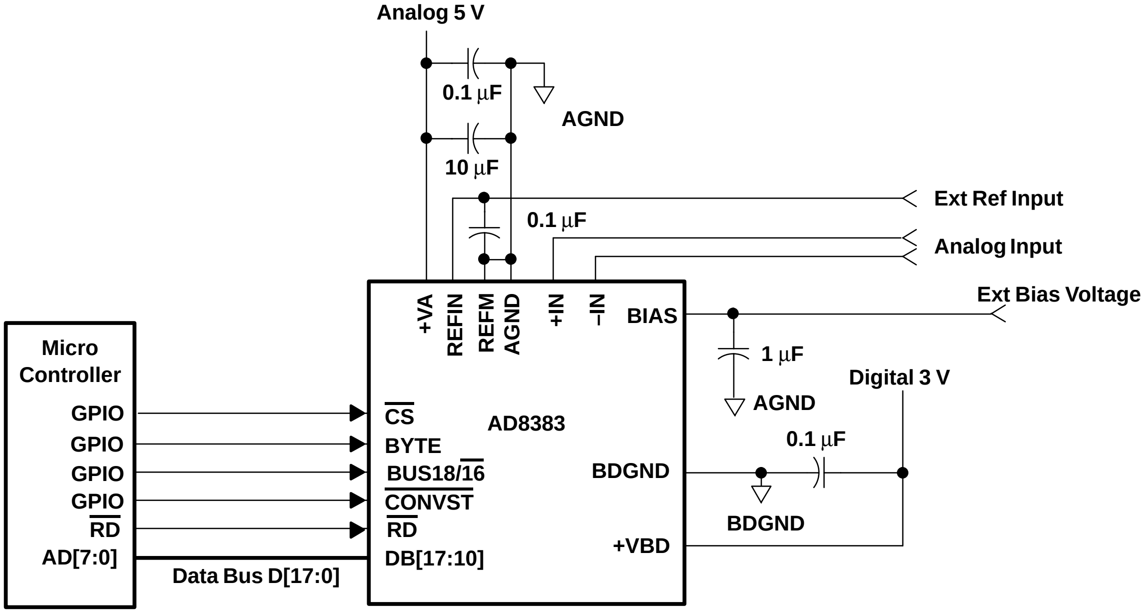

Figure 37. ADS8383 Application Circuitry

PRINCIPLES OF OPERATION

The ADS8383 is a high-speed successive approximation register (SAR) analog-to-digital converter (ADC). The architecture is based on charge redistribution which inherently includes a sample/hold function. See Figure 37 for the application circuit for the ADS8383.

The conversion clock is generated internally. The conversion time of 1.6 µs is capable of sustaining a 500-kHz throughput.

The analog input is provided to two input pins: +IN and –IN. When a conversion is initiated, the differential input on these pins is sampled on the internal capacitor array. While a conversion is in progress, both inputs are disconnected from any internal function.

REFERENCE

The ADS8383 can operate with an external 4.096-V reference for a corresponding full-scale range of 4.096 V.

BIASING THE ADS8383

The ADS8383 requires an external 2.048-V bandgap reference to generate the bias currents for internal circuitry. Figure 38 shows the internal circuitry used to generate the bias currents. The bias generation circuit also pumps 100 µA (150 µA max) out from the BIAS pin. The bandgap used should be capable of sinking 100 µA (150 µA max) while holding the voltage on the pin steady. Table 1 shows the specification of the bandgap used to drive the BIAS pin of the ADS8383.

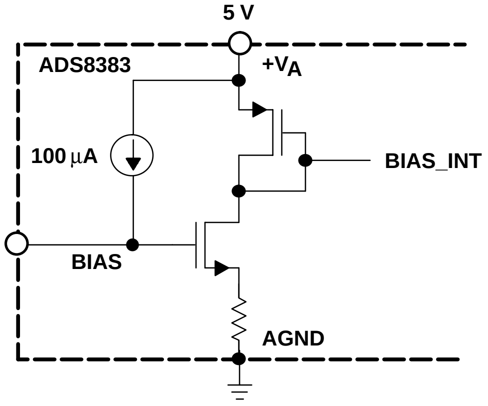

Figure 38. Bias Current Generation

Table 1. Bias Specifications

PARAMETER	MIN	TYP	MAX	UNITS
Output Voltage	2	2.048	2.1	V
I_{sink}		100	150	µA

Any common bandgap like REF3020 can be used to drive the BIAS pin of the ADS8383. Figure 39 shows how REF3020 can be used with the ADS8383. A 1 µF decoupling capacitor is recommended between pins 2 and AGND of the ADS8383 for optimal performance.

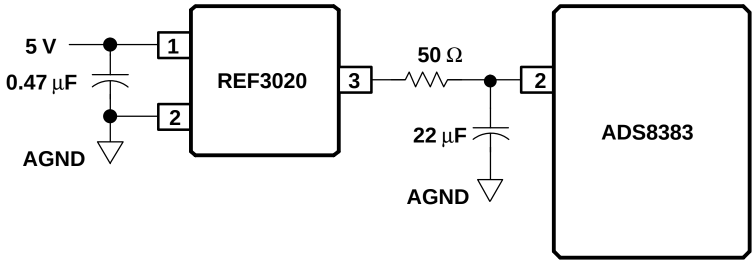

Figure 39. Using the REF3020 to Drive the ADS8383 BIAS Pin

ANALOG INPUT

When the converter enters the hold mode, the voltage difference between the +IN and –IN inputs is captured on the internal capacitor array. The voltage on the –IN input is limited between –0.2 V and 0.2 V, allowing the input to reject small signals which are common to both the +IN and –IN inputs. The +IN input has a range of –0.2 V to V_{ref} + 0.2 V. The input span (+IN – (–IN)) is limited to 0 V to V_{ref}.

The input current on the analog inputs depends upon a number of factors: sample rate, input voltage, and source impedance. Essentially, the current into the ADS8383 charges the internal capacitor array during the sample period. After this capacitance has been fully charged, there is no further input current. The source of the analog input voltage must be able to charge the input capacitance (45 pF) to an 18-bit settling level within the acquisition time (400 ns) of the device. When the converter goes into the hold mode, the input impedance is greater than 1 GΩ.

Care must be taken regarding the absolute analog input voltage. To maintain the linearity of the converter, the +IN and –IN inputs and the span (+IN – (–IN)) should be within the limits specified. Outside of these ranges, the converter's linearity may not meet specifications. To minimize noise, low bandwidth input signals with low-pass filters should be used.

Care should be taken to ensure that the output impedance of the sources driving the +IN and –IN inputs are matched. If this is not observed, the two inputs could have different setting times. This may result in offset error, gain error, and linearity error which changes with temperature and input voltage.

DIGITAL INTERFACE

Timing And Control

See the timing diagrams in the specifications section for detailed information on timing signals and their requirements.

The ADS8383 uses an internal oscillator generated clock which controls the conversion rate and in turn the throughput of the converter. No external clock input is required.

Conversions are initiated by bringing the $\overline{\text{CONVST}}$ pin low for a minimum of 20 ns (after the 20 ns minimum requirement has been met, the $\overline{\text{CONVST}}$ pin can be brought high), while $\overline{\text{CS}}$ is low. The ADS8383 switches from the sample to the hold mode on the falling edge of the $\overline{\text{CONVST}}$ command. A clean and low jitter falling edge of this signal is important to the performance of the converter. The BUSY output is brought high immediately following $\overline{\text{CONVST}}$ going low. BUSY stays high through the conversion process and returns low when the conversion has ended.

Sampling starts with the falling edge of the BUSY signal when $\overline{\text{CS}}$ is tied low or starts with the falling edge of $\overline{\text{CS}}$ when BUSY is low.

Both $\overline{\text{RD}}$ and $\overline{\text{CS}}$ can be high during and before a conversion with one exception ($\overline{\text{CS}}$ must be low when $\overline{\text{CONVST}}$ goes low to initiate a conversion). Both the $\overline{\text{RD}}$ and $\overline{\text{CS}}$ pins are brought low in order to enable the parallel output bus with the conversion.

Reading Data

The ADS8383 outputs full parallel data in straight binary format as shown in Table 2. The parallel output is active when $\overline{\text{CS}}$ and $\overline{\text{RD}}$ are both low. There is a minimal quiet zone requirement around the falling edge of $\overline{\text{CONVST}}$. This is 125 ns prior to the falling edge of $\overline{\text{CONVST}}$ and 40 ns after the falling edge. No data read should be attempted within this zone. Any other combination of $\overline{\text{CS}}$ and $\overline{\text{RD}}$ sets the parallel output to 3-state. BYTE and BUS18/$\overline{16}$ are used for multiword read operations. BYTE is used whenever lower bits on the bus are output on the higher byte of the bus. BUS18/$\overline{16}$ is used whenever the last two bits on the 18-bit bus is output on either bytes of the higher 16-bit bus. Refer to Table 2 for ideal output codes.

Table 2. Ideal Input Voltages and Output Codes

DESCRIPTION	ANALOG VALUE	DIGITAL OUTPUT STRAIGHT BINARY	
FULL SCALE RANGE	V_{ref}		
Least significant bit (LSB)	V_{ref}/262144	BINARY CODE	HEX CODE
Full scale	V_{ref} – 1 LSB	11 1111 1111 1111 1111	3FFFF
Midscale	V_{ref}/2	10 0000 0000 0000 0000	20000
Midscale – 1 LSB	V_{ref}/2 – 1 LSB	01 1111 1111 1111 1111	1FFFF
Zero	0 V	00 0000 0000 0000 0000	00000

The output data is a full 18-bit word (D17–D0) on DB17–DB0 pins (MSB–LSB) if both BUS18/$\overline{16}$ and BYTE are low.

The result may also be read on a 16-bit bus by using only pins DB17–DB2. In this case two reads are necessary: the first as before, leaving both BUS18/$\overline{16}$ and BYTE low and reading the 16 most significant bits (D17–D2) on pins DB17–DB2, then bringing BUS18/$\overline{16}$ high while holding BYTE low. When BUS18/$\overline{16}$ is high, the lower two bits (D1–D0) appear on pins DB3–DB2.

The result may also be read on an 8-bit bus for convenience. This is done by using only pins DB17–DB10. In this case three reads are necessary: the first as before, leaving both BUS18/$\overline{16}$ and BYTE low and reading the 8 most significant bits on pins DB17–DB10, then bringing BYTE high while holding BUS18/$\overline{16}$ low. When BYTE is high, the medium bits (D9–D2) appear on pins DB17–DB10. The last read is done by bringing BUS18/$\overline{16}$ high while holding BYTE high. When BUS18/$\overline{16}$ is high, the lower two bits (D1–D0) appear on pins DB11–DB10. The last read cycle is not necessary if only the first 16 most significant bits are of interest.

All of these multiword read operations can be performed with multiple active $\overline{\text{RD}}$ (toggling) or with $\overline{\text{RD}}$ held low for simplicity. This is referred to as the AUTO READ operation. Note that $\overline{\text{RD}}$ may not be tied to BDGND permanently due to the requirement of power-on initialization.

Table 3. Conversion Data Read Out

BYTE	BUS18/$\overline{16}$	DATA READ OUT				
		DB17–DB12	DB11–DB10	DB9–DB4	DB3–DB2	DB1–DB0
High	High	All One’s	D1–D0	All One’s	All One’s	All One’s
Low	High	All One’s	All One’s	All One’s	D1–D0	All One’s
High	Low	D9–D4	D3–D2	All One’s	All One’s	All One’s
Low	Low	D17–D12	D11–D10	D9–D4	D3–D2	D1–D0

POWER-ON INITIALIZATION

At first power on there are three read cycles required ($\overline{\text{RD}}$ must be toggled three times). If conversion cycle is attempted before these intialization read cycles, the first three conversion cycles will not produce valid results. This is used to load factory trimming data for a specific device to assure high accuracy of the converter. Because of this requirement, the $\overline{\text{RD}}$ pin cannot be tied permanently to BDGND. System designers can still achieve the AUTO READ function if the power-on requirement is satisfied.

LAYOUT

For optimum performance, care should be taken with the physical layout of the ADS8383 circuitry.

As the ADS8383 offers single-supply operation, it will often be used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to achieve good performance from the converter.

The basic SAR architecture is sensitive to glitches or sudden changes on the power supply, reference, ground connections and digital inputs that occur just prior to latching the output of the analog comparator. Thus, driving any single conversion for an n-bit SAR converter, there are at least n *windows* in which large external transient voltages can affect the conversion result. Such glitches might originate from switching power supplies, nearby digital logic, or high power devices.

The degree of error in the digital output depends on the reference voltage, layout, and the exact timing of the external event.

On average, the ADS8383 draws very little current from an external reference as the reference voltage is internally buffered. If the reference voltage is external and originates from an op amp, make sure that it can drive the bypass capacitor or capacitors without oscillation. A 0.1-µF bypass capacitor is recommended from pin 1 (REFIN) directly to pin 48 (REFM). REFM and AGND should be shorted on the same ground plane under the device.

The AGND and BDGND pins should be connected to a clean ground point. In all cases, this should be the analog ground. Avoid connections which are too close to the grounding point of a microcontroller or digital signal processor. If required, run a ground trace directly from the converter to the power supply entry point. The ideal layout consists of an analog ground plane dedicated to the converter and associated analog circuitry.

As with the AGND connections, +VA should be connected to a 5-V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. Power to the ADS8383 should be clean and well bypassed. A 0.1-µF ceramic bypass capacitor should be placed as close to the device as possible. See Table 4 for the placement of the capacitor. In addition, a 1-µF to 10-µF capacitor is recommended. In some situations, additional bypassing may be required, such as a 100-µF electrolytic capacitor or even a Pi filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5-V supply, removing the high frequency noise.

Table 4. Power Supply Decoupling Capacitor Placement

POWER SUPPLY PLANE	CONVERTER ANALOG SIDE	CONVERTER DIGITAL SIDE
SUPPLY PINS		
Pin pairs that require shortest path to decoupling capacitors	(4,5), (8,9), (10,11), (13,15), (43,44), (45,46)	(24,25)
Pins that require no decoupling	12, 14	37

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third–party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof.
