

Lithium Ion Charge Management IC with Integrated Switching Controller

Features

- ▶ Safe charge of Li-Ion battery packs
- ▶ Pulse-width modulation control for current and voltage regulation
- ▶ Programmable high-side/low-side current-sense
- ▶ Fast charge terminated by selectable minimum current; safety backup termination at maximum time
- ▶ Pre-charge qualification detects shorted or damaged cells and conditions battery
- ▶ Charging continuously qualified by temperature and voltage limits
- ▶ Direct LED control outputs to display charge status and fault conditions

General Description

The bq2954 Li-Ion Charge-Management IC uses a flexible pulse-width modulation regulator to control voltage and current during charging. The regulator frequency is set by an external capacitor for design flexibility. The switch-mode design minimizes power dissipation.

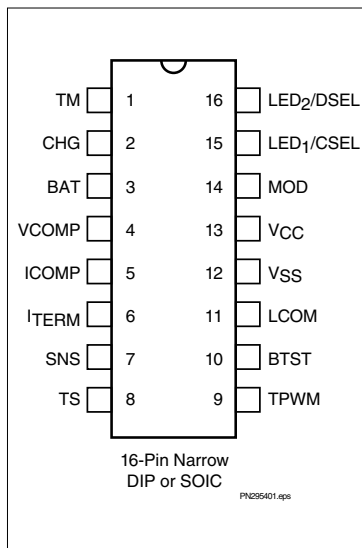

For safety, the bq2954 inhibits fast charging until the battery voltage and temperature are within configured limits. If the battery voltage is less than the low-voltage threshold, the bq2954 provides low-current conditioning of the battery.

For charge qualification, the bq2954 uses an external thermistor to measure battery temperature. Charging begins when power is applied or the battery is inserted.

The bq2954 charges a battery in two phases. First a constant-current phase replenishes approximately 70% of battery capacity. Then a voltage-regulation phase completes the battery charge.

The bq2954 provides status indications of all charger states and faults for accurate determination of the battery and charge-system conditions.

Pin Connections

Pin Names

TM	Time-out programming input	TPWM	Regulator timebase input
CHG	Charge active output	BTST	Battery test output
BAT	Battery voltage input	LCOM	Common LED output
VCOMP	Voltage loop comp input	VSS	System ground
ICOMP	Current loop comp input	VCC	5.0V±10% power
ITERM	Minimum current termination select input	MOD	Modulation control output
SNS	Sense resistor input	LED1/CSEL	Charge status output 1/ Charge sense select input
TS	Temperature sense input	LED2/DSEL	Charge status output 2/ Display select input

bq2954

Pin Descriptions

TM	Time-out programming input Sets the maximum charge time. The resistor and capacitor values are determined using Equation 5. Figure 10 shows the resistor/capacitor connection.	TPWM	Regulation timebase input Uses an external timing capacitor to ground to set the pulse-width modulation (PWM) frequency. See Equation 7.
CHG	Charge active output An open-drain output is driven low when the battery is removed, during a temperature pend, when a fault condition is present, or when charge is done. CHG can be used to disable a high-value load capacitor to detect quickly any battery removal.	BTST	Battery test output Driven high in the absence of a battery in order to provide a potential at the battery terminal when no battery is present.
BAT	Battery voltage input Sense input. This potential is generally developed using a high-impedance resistor divider network connected between the positive and the negative terminals of the battery. See Figures 6 and 7 and Equation 1.	LCOM	Common LED output Common output for LED ₁₋₂ . This output is in a high-impedance state during initialization to read programming input on DSEL and CSEL.
VCOMP	Voltage loop compensation input Connects to an external R-C network to stabilize the regulated voltage.	VSS	Ground
ICOMP	Current loop compensation input Connects to an external R-C network to stabilize the regulated current.	VCC	VCC supply 5.0V, ±10%
ITERM	Charge full and minimum current termination select Three-state input is used to set I _{FULL} and I _{MIN} for fast charge termination. See Table 4.	MOD	Current-switching control output Pulse-width modulated push/pull output used to control the charging current to the battery. MOD switches high to enable current flow and low to inhibit current flow. (The maximum duty cycle is 80%.)
SNS	Charging current sense input Battery current is sensed via the voltage developed on this pin by an external sense-resistor.	LED₁-LED₂	Charger display status 1-2 outputs Drivers for the direct drive of the LED display. These outputs are tri-stated during initialization so that DSEL and CSEL can be read.
TS	Temperature sense input Used to monitor battery temperature. An external resistor-divider network sets the lower and upper temperature thresholds. (See Figures 8 and 9 and Equations 3 and 4.)	DSEL	Display select input (shared pin with LED₂) Three-level input that controls the LED ₁₋₂ charge display modes.
		CSEL	Charge sense-select input (shared pin with LED₁) Input that controls whether current is sensed on low side of battery or high side of battery. A current mirror is required for high-side sense.

Figure 1. Functional Block Diagram

Functional Description

The bq2954 functional operation is described in terms of the following (Figure 1):

- Charge algorithm
- Charge qualification
- Charge status display
- Configuring the display and termination
- Voltage and current monitoring
- Battery insertion and removal
- Temperature monitoring
- Maximum time-out
- Charge regulation
- Recharge after fast charge

Charge Algorithm

The bq2954 uses a two-phase fast-charge algorithm. In phase 1, the bq2954 regulates constant current until the voltage on the BAT pin, V_{BAT} , rises to the internal threshold, V_{REG} . The bq2954 then transitions to phase 2 and regulates constant voltage ($V_{BAT} = V_{REG}$) until the charging current falls below the programmed I_{MIN} threshold. Fast charge then terminates, and the bq2954 enters the Charge Complete state. (See Figure 2.)

Charge Qualification

The bq2954 starts a charge cycle when power is applied while a battery is present or when a battery is inserted. Figure 2 shows the state diagram for the bq2954. The bq2954 first checks that the battery temperature is within the allowed, user-configurable range. If the temperature is out of range, the bq2954 remains in the QUALIFICATION state (S01) and waits until the battery temperature and voltage are within the allowed range.

If during any state of charge, a temperature excursion occurs HOT, the bq2954 proceeds to the DONE state (S04) and indicates this state on the LED outputs and provides no current. If this occurs, the bq2954 remains in the DONE state unless the following two conditions are met:

- Temperature falls within valid charge range
- V_{BAT} falls below the internal threshold, V_{RCHG}

If these two conditions are met, a new charge cycle begins. During any state of charge, if a temperature excursion occurs COLD, the bq2954 terminates charge and returns to the QUALIFICATION state (S01). Charge restarts if V_{BAT} and temperature are in valid range.

When the temperature and voltage are valid, the bq2954 enters the CONDITIONING state (S02) and regulates current to $I_{COND} (=I_{MAX}/10)$. After an initial holdoff period t_{HO} (which prevents the IC from reacting to transient voltage spikes that may occur when charge current is first applied), the IC begins monitoring V_{BAT} . If V_{BAT} does not rise to at least V_{MIN} before the expiration of

Figure 2. bq2954 Charge Algorithm

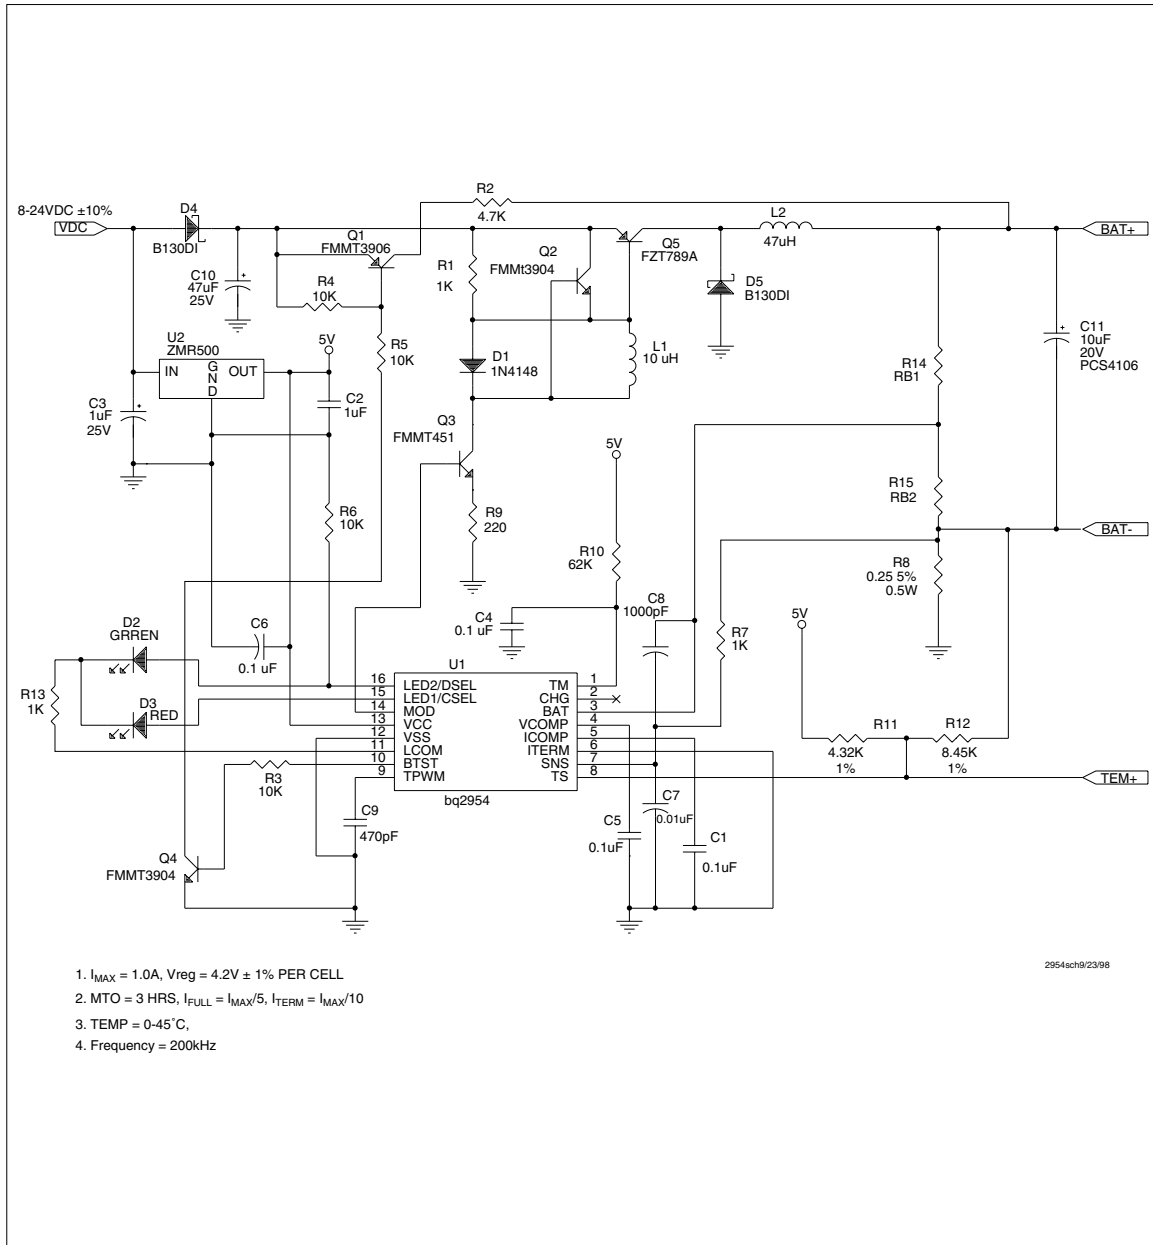

Figure 3. High-Efficiency Li-Ion Charger for 1-4 Cells

Table 1. Normal Fast Charge Cycle

GR295401.eps

time-out limit t_{QT} (i.e., the battery has failed short), the bq2954 enters the Fault state. Then t_{QT} is set to 25% of t_{MTO} . If V_{MIN} is achieved before expiration of the time limit, the bq2954 begins fast charging.

Once in the Fault state, the bq2954 waits until V_{CC} is cycled or a new battery insertion is detected. It then starts a new charge cycle and begins the qualification process again.

Charge Status Display

Charge status is indicated by the LED driver outputs LED₁–LED₂. Three display modes (Tables 1– 3) are available in the bq2954 and are selected by configuring pin DSEL. Table 1 illustrates a normal fast charge cycle, Table 2 a recharge-after-fast-charge cycle, and Table 3 an abnormal condition.

Configuring the Display Mode, I_{FULL}/I_{MIN} , and I_{SENSE}

DSEL/LED₂ and CSEL/LED₁ are bi-directional pins with two functions: as LED driver pins (output) and as programming pins (input). The selection of pull-up, pull-down, or no-resistor programs the display mode on DSEL as shown in Tables 1 through 3. A pull-down or no-resistor programs the current-sense mode on CSEL.

The bq2954 latches the programming data sensed on the DSEL and CSEL input when V_{CC} rises to a valid level. The LEDs go blank for approximately 400ms (typical) while new programming data are latched.

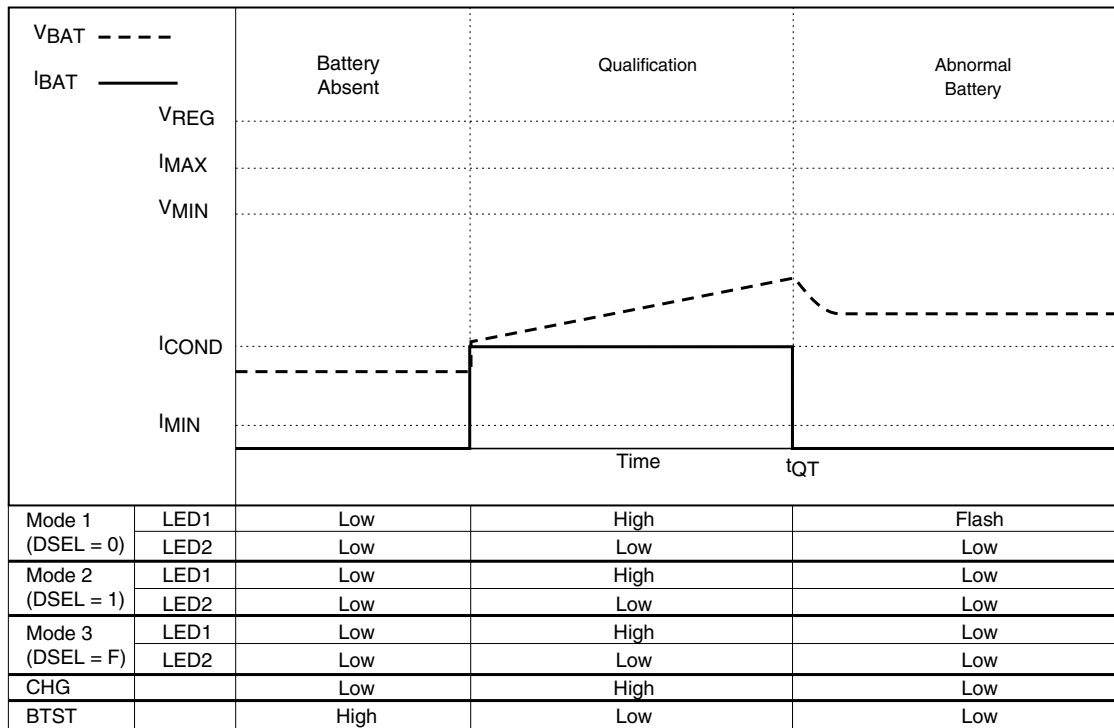

When fast charge reaches a condition where the charging current drops below I_{FULL} , the LED₁ and LED₂ outputs indicate a full-battery condition. Fast charge terminates when the charging current drops below the

Table 4. IFULL and IMIN Thresholds

ITERM	IFULL	IMIN
0	IMAX/5	IMAX/10
1	IMAX/10	IMAX/15
Z	IMAX/15	IMAX/20

minimum current threshold, I_{MIN} . The I_{FULL} and I_{MIN} thresholds are programmed using the I_{TERM} input pin (See Table 4.)

Figures 4 and 5 show the bq2954 configured for display mode 2 and $I_{FULL} = I_{MAX}/5$ while $I_{MIN} = I_{MAX}/10$.

Voltage and Current Monitoring

In low-side current sensing, the bq2954 monitors the battery pack voltage as a differential voltage between BAT and pins. In high-side current sensing, the bq2954 monitors the battery pack voltage as a differential voltage between BAT and VSS pins. This voltage is derived by scaling the battery voltage with a voltage divider. (See Figures 6 and 7.) The resistance of the voltage divider must be high enough to minimize battery drain but low enough to minimize noise susceptibility. $RB1 + RB2$ is typically between $150k\Omega$ and $1M\Omega$. The voltage-divider resistors are calculated from the following:

$$\frac{RB1}{RB2} = \frac{N * V_{CELL}}{V_{REG}} - 1 \quad (1)$$

where

V_{CELL} = Manufacturer-specified charging cell voltage
 N = Number of cells in series
 $V_{REG} = 2.05V$

The current sense resistor, R_{SNS} (see Figures 6 and 7), determines the fast-charge current. The value of R_{SNS} is given by the following:

$$R_{SNS} = \frac{0.25V}{I_{MAX}} \quad (2)$$

where I_{MAX} is the current during the constant-current phase of the charge cycle. (See Table 1.)

Battery Insertion and Removal

V_{BAT} is interpreted by the bq2954 to detect the presence or absence of a battery. The bq2954 determines that a battery is present when V_{BAT} is between the High-Voltage Cutoff ($V_{HCO} = V_{REG} + 0.25V$) and the Low-Voltage Cutoff ($V_{LCO} = 0.8V$). When V_{BAT} is outside this range, the bq2954 determines that no battery is present and transitions to the battery test state, testing for valid battery voltage. The bq2954 detects battery removal when V_{BAT} falls below V_{LCO} . The $BTST$ pin is driven high during battery test and can activate an external battery contact pull-up. This pull-up may be used to activate an over-discharged Li-Ion battery pack. The V_{HCO} limit implicitly serves as an over-voltage charge fault. The CHG output can be used to disconnect capacitors from the regulation circuitry in order to quickly detect a battery-removed condition.

Battery insertion is detected within 500ms. Transition to the fast-charge phase, however, will not occur for time t_{HO} (approximately one second), even if voltage qualification V_{MIN} is reached. This delay prevents a voltage spike at the BAT input from causing premature entry into the fast-charge phase. It also creates a delay in detection of battery removal if the battery is removed during this hold-off period.

Temperature Monitoring

Temperature is measured as a *differential* voltage between TS and BAT-. This voltage is typically generated by a NTC (negative temperature coefficient) thermistor and thermistor linearization network. The bq2954 compares this voltage to its internal threshold voltages to determine if charging is allowed. These thresholds are the following:

- High-Temperature Cutoff Voltage: $V_{TCO} = 0.4 * V_{CC}$
This voltage corresponds to the maximum temperature (TCO) at which charging is allowed.
- High-Temperature Fault Voltage: $V_{HTF} = 0.44 * V_{CC}$
This voltage corresponds to the temperature (HTF) at which charging resumes after exceeding TCO.
- Low-Temperature Fault Voltage: $V_{LTF} = 0.6 * V_{CC}$
This voltage corresponds to the minimum temperature (LTF) at which charging is allowed.

Charging is inhibited if the temperature is outside the LTF—TCO window. Once the temperature exceeds TCO, it must drop below HTF before charging resumes.

RT1 and RT2 for the thermistor linearization network are determined as follows:

$$0.6 * V_{CC} = \frac{V}{1 + \frac{RT1 * (RT2 + R_{LTF})}{(RT2 * R_{LTF})}} \quad (3)$$

$$0.44 = \frac{1}{1 + \frac{RT1 * (RT2 + R_{HTF})}{(RT2 * R_{HTF})}} \quad (4)$$

where

R_{LTF} = thermistor resistance at LTF

R_{HTF} = thermistor resistance at HTF

$V = V_{CC} - 0.250$ in low-side current sensing

$V = V_{CC}$ in high-side current sensing

TCO is determined by the values of RT1 and RT2. 1% resistors are recommended.

Figure 7. Configuring the Battery Divider (High-Side Sense)

Figure 8. Low-Side Temperature Sensing

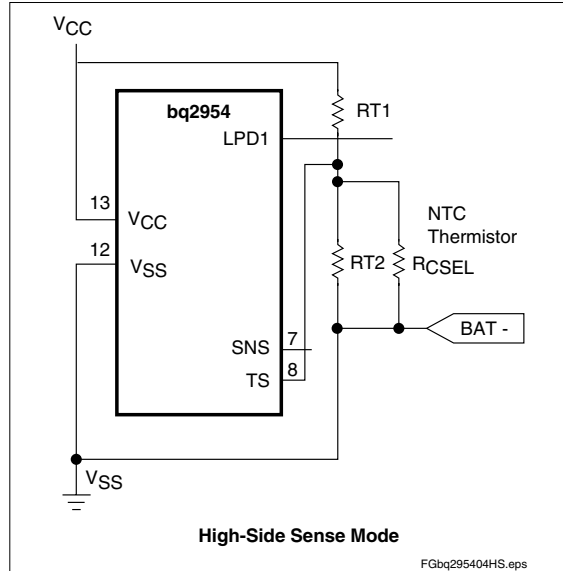

Figure 9. High-Side Temperature Sensing

Figure 10. R-C Network/Setting MTO

Disabling Temperature Sensing

Temperature sensing can be disabled by placing a 10kΩ resistor between TS and BAT- and a 10kΩ resistor between TS and VCC. See Figures 8 and 9.

Maximum Time-Out

Maximum Time-Out period (t_{MTO}) is programmed from 1 to 24 hours by an R-C network on the TM pin (see Figure 10) per the following equation:

$$t_{MTO} = 500 * R * C \quad (5)$$

where R is in ohms, C is in Farads, and t_{MTO} is in hours. The recommended value for C is 0.1μF.

The MTO timer is reset at the beginning of fast charge. If the MTO timer expires during the voltage regulation phase, fast charging terminates and the bq2954 enters the Charge Complete state. If the conditioning phase continues for time equal to t_{QT} ($MTO/4$) and the battery potential does not reach V_{MIN} , the bq2954 enters the fault state and terminates charge. See Table 3. If the MTO timer expires during the current-regulation phase (V_{BAT} never reaches V_{REG}), fast charging is terminated, and the bq2954 enters the fault state.

bq2954

Charge Regulation

The bq2954 controls charging through pulse-width modulation of the MOD output pin, supporting both constant-current and constant-voltage regulation. Charge current is monitored at the SNS pin, and charge voltage is monitored at the BAT pin. These voltages are compared to an internal reference, and the MOD output is modulated to maintain the desired value. The maximum duty cycle is 80% .

Voltage at the SNS pin is determined by the value of resistor R_{SNS} , so nominal regulated current is set by the following equation:

$$I_{MAX} = V_{SNS} / R_{SNS} \quad (6)$$

The switching frequency of the MOD output is determined by an external capacitor (C_{PWM}) between the pin TPWM and VSS pins, per the following:

$$f_{PWM} = \frac{1 * 10^{-4}}{C_{PWM}} \quad (7)$$

Where C is in Farads and the frequency is in Hz. A typical switching rate is 100kHz, implying $C_{PWM} = 0.001\mu F$. MOD pulse width is modulated between 0 and 80% of the switching period.

To prevent oscillation in the voltage and current control loops, frequency compensation networks (C and R-C respectively) are typically required on the VCOMP and ICOMP pins .

Recharge After Fast Charge

Once charge completion occurs, a fast charge is initiated when the battery voltage falls below VRECHG threshold. A delay of approximately one second passes before recharge begins so that adequate time is allowed to detect battery removal. (See Table 1.)

Absolute Maximum Ratings

Symbol	Parameter	Minimum	Maximum	Unit	Notes
V _{CC}	V _{CC} relative to V _{SS}	-0.3	+7.0	V	
V _T	DC voltage applied on any pin excluding V _{CC} relative to V _{SS}	-0.3	+7.0	V	
T _{OPR}	Operating ambient temperature	-20	+70	°C	Commercial
		-40	+85	°C	Industrial "N"
T _{STG}	Storage temperature	-55	+125	°C	
T _{SOLDER}	Soldering temperature	-	+260	°C	10s max.

Note: Permanent device damage may occur if **Absolute Maximum Ratings** are exceeded. Functional operation should be limited to the Recommended DC Operating Conditions detailed in this data sheet. Exposure to conditions beyond the operational limits for extended periods of time may affect device reliability.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
