

- ◇STRUCTURE Silicon Monolithic Integrated Circuit
- ◇PRODUCT NAME 128 x 16 bit Electrically Erasable Programmable ROM
- ◇PART NUMBER BR93L56/F/RF/FJ/RFJ/FV/RFV/RFVM-W
- ◇OUTLINE DIMENSION Fig. - 1 (Plastic Mold)
- ◇BLOCK DIAGRAM Fig. - 2
- ◇FUNCTION General purpose
- ◇FEATURES
 - 128words x 16 bit organization 2kbit serial EEPROM
 - Wide operating supply voltage range(1.8~5.5V)
 - Three wire serial interface
 - Auto-increment of registers address for Read mode
 - Prevent inadvertent writing
 - Defaults to power up with write-disabled state
 - Software instructions for write-enable/disable
 - Write inhibit at low Vcc
 - Automatic erase-before write and self-timed programming cycle
 - Read/Busy Status
 - Low Power Consumption
 - Write (5V) : 1.2mA(Typ.)
 - Read (5V) : 0.3mA(Typ.)
 - Standby (5V) : 0.1 μA(Typ.)
 - Full TTL compatible input and output
 - Space Saving DIP/SOP/SOP-J/SSOP-B/MSOP8pin Package
 - High reliability fine pattern CMOS technology
 - 40 Years Data Retention
 - 1,000,000 Write/Erase Cycle
 - Initial data FFFFh in all address

◇ABSOLUTE MAXIMUM RATINGS(Ta=25°C)

| Parameter | Symbol | Rating | | Unit |
|-----------------------|--------|-----------------|---------|------|
| Supply Voltage | Vcc | -0.3 ~ 6.5 | | V |
| Power dissipation | Pd | DIP8 | 800(※1) | mW |
| | | SOP8(F,RF) | 450(※2) | |
| | | SOP-J8(FJ,RFJ) | 450(※3) | |
| | | SSOP-B8(FV,RFV) | 300(※4) | |
| | | MSOP8(RFVM) | 310(※5) | |
| Storage Temperature | Tstg | -65 ~ 125 | | °C |
| Operating Temperature | Topr | -40 ~ 85 | | °C |
| Terminal Voltage | - | -0.3 ~ Vcc+0.3 | | V |

- ※1 Degradation is done at 8.0mW/°C for operation above Ta=25°C
- ※2 Degradation is done at 4.5mW/°C for operation above Ta=25°C
- ※3 Degradation is done at 4.5mW/°C for operation above Ta=25°C
- ※4 Degradation is done at 3.0mW/°C for operation above Ta=25°C
- ※5 Degradation is done at 3.1mW/°C for operation above Ta=25°C

◇RECOMMENDED OPERATING CONDITION

| Parameter | Symbol | Rating | Unit |
|----------------|-----------------|---------------------|------|
| Supply Voltage | V _{cc} | 1.8 ~ 5.5 | V |
| Input Voltage | V _{in} | 0 ~ V _{cc} | |

◇ELECTORICAL CHARACTERISTICS

Unless otherwise specified (T_a=-40~85°C, V_{cc}=2.5~5.5V)

| Parameter | Symbol | Limit | | | Unit | Condition | Test Circuit |
|----------------------|--------|-------------------------|------|-------------------------|------|---|--------------|

Fig.-6 Input Leakage Current Test Circuit

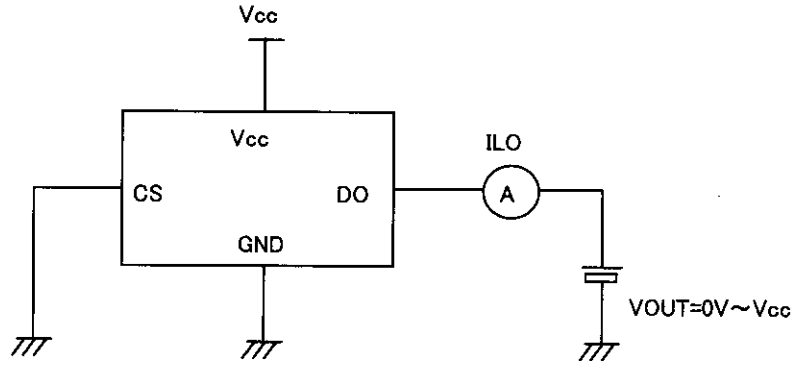

Fig.-7 Output Leakage Current Test Circuit

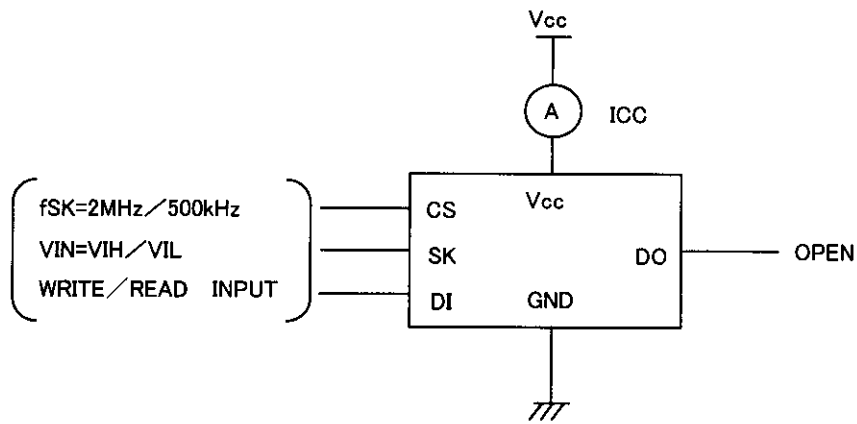

Fig.-8 Operating Current Test Circuit

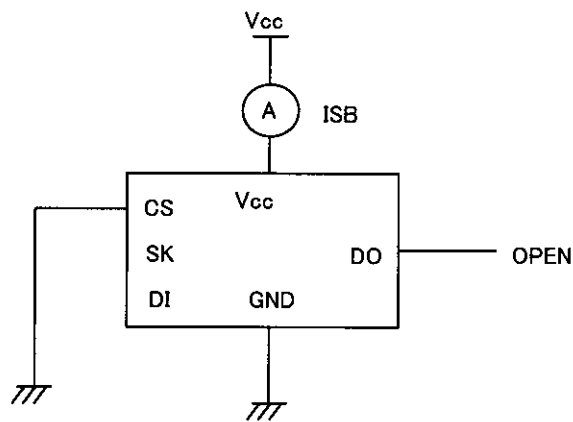

Fig.-9 Standby Current Test Circuit

◇ SYNCHRONOUS DATA TIMING

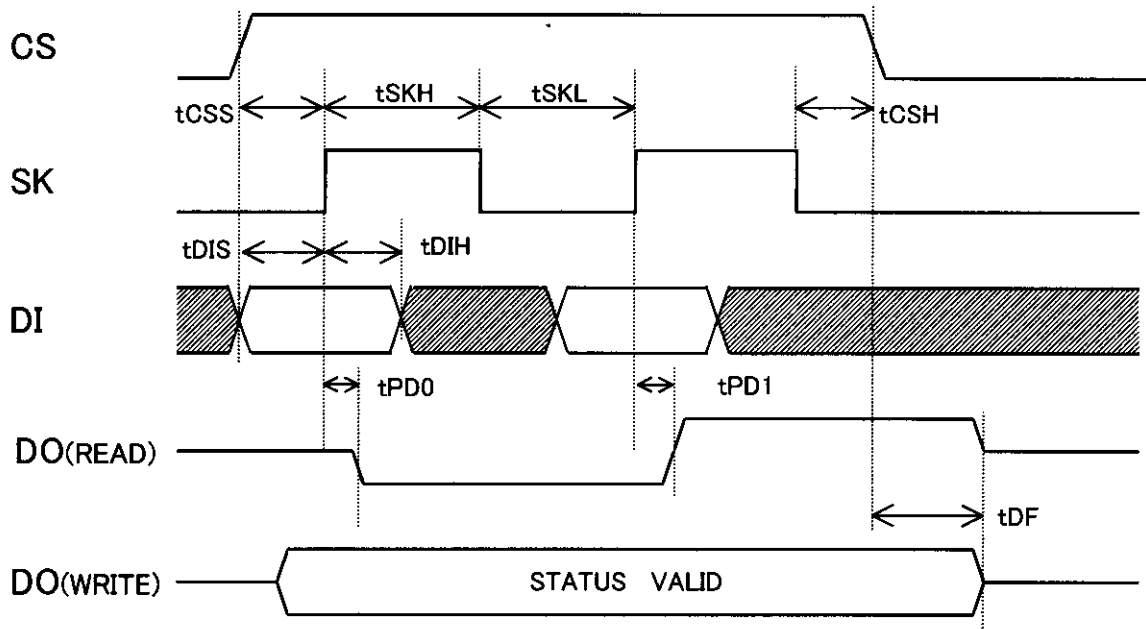

Fig.-10 Synchronous data timing

- Input Data are clocked in from DI pin at the rising edge of the clock (SK).
- Output data from DO pin toggles at the rising edge of the clock (SK) during read mode.
- When CS is brought "H" after the write command, STATUS signal ($\overline{\text{Ready/Busy}}$) becomes active on DO pin till the start bit of next command.
STATUS signal is active during CS is high, and DO pin outputs High-Z when CS is low.
- For internal reset, CS must be brought "L" after any commands.

◇AC OPERATING CHARACTERISTICS(T_a=-40~85°C、V_{cc}=2.5~5.5V)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|----------------------------|--------|------|------|------|------|
| SK Clock Frequency | fSK | - | - | 2 | MHz |
| SK High Time | tSKH | 230 | - | - | ns |

◇INSTRUCTION CODE

| Instruction | Start Bit | Op Code | Address | Data |
|-----------------------|-----------|---------|------------------------|------------------------|
| Read (*1) | 1 | 10 | * A6,A5,A4,A3,A2,A1,A0 | D15~D0 (READ DATA) |
| Write Enable (WEN) | 1 | 00 | 1 1 * * * * * * | |
| Write (*2) | 1 | 01 | * A6,A5,A4,A3,A2,A1,A0 | D15~D0 (WRITE DATA) |
| Write All (WRAL) (*2) | 1 | 00 | 0 1 * * * * * * | D15~D0 (WRITE DATA) |
| Write Disable (WDS) | 1 | 00 | 0 0 * * * * * * | |
| Erase | 1 | 11 | * A6,A5,A4,A3,A2,A1,A0 | |
| Erase All (ERAL) | 1 | 00 | 1 0 * * * * * * | |

*Address and data must be transferred from MSB.

“” Means either VIH or VIL

※START BIT

Start Bit means a logical “1” input after CS goes high.

This start bit proceeds beginning of all instructions.

(*1) : After one Read instruction segment is received, when CS remains High , the address pointer automatically cycles to the next higher register address, giving a continuous string of output data, depending on the device and the starting address.

(*2) : The previous data in the address locations are automatically erased and written the desired data, when “Write” or “Write All” instruction is received. No erase command is needed.

◇TIMING CHART

1.READ CYCLE TIMING

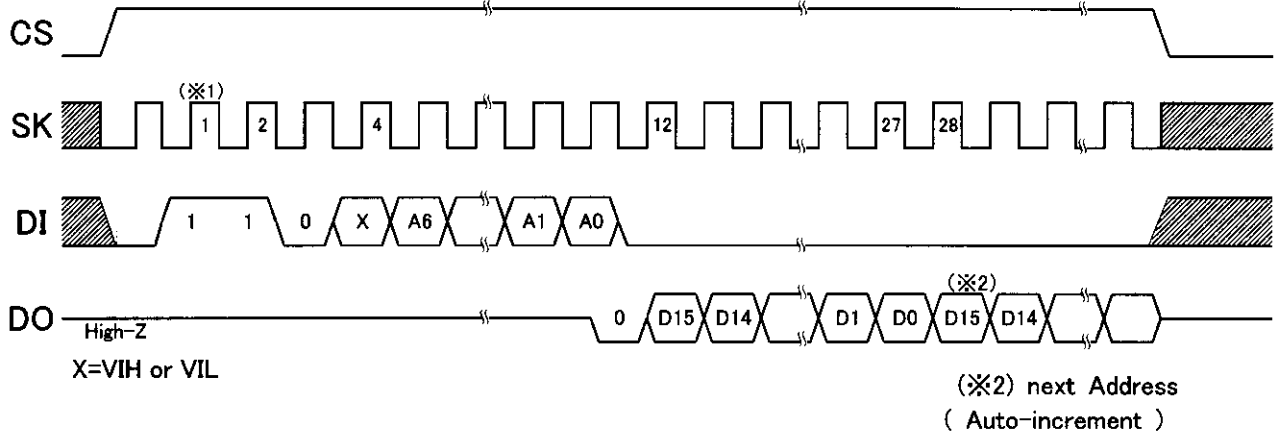

Fig.-11 Read Cycle Timing

(⊗1) Start bit

This device recognizes the first data “1” after CS goes high as a start bit. You can input plenty of “0” before “1”, still the data “1” works as a start bit.

○The addressed 16 bit of data are clocked out after “Read” instruction is received. During the 11th clock is high, the device output “0” (dummy 0) as a sign of data output start.

This device has the auto-increment feature that provides the whole data of the memory array with one read command.

Just keep CS high and SK clocking, the device outputs the next address data following the addressed 16 bits of data, please.

2.WRITE ENABLE CYCLE TIMING

Fig.-12 Write Enable Cycle Timing

○After the power is on, the device is in the disable mode.

This “Write Enable” instruction must be proceeded before the any write commands.

After “Write Enable” is executed, the device becomes in the enable mode.

This enable mode is valid until the power is off or the device receives “Write Disable” instruction.

Neither the “Write Enable” nor the “Write Disable” instruction has any effect on the “Read” instruction. This device does not matter the state (“H” or “L”) of DI after the 6th clock of SK. Please keep inputting six more SK signals.

3. WRITE CYCLE TIMING

Fig.-13 Write Cycle Timing

○ This "Write" command writes 16 bits of data into the specified address.

The falling edge of CS after the 27th clock initiates high voltage cycle, which writes the data into non-volatile memory array.

Ready/ $\overline{\text{Busy}}$ signal indicates this high voltage cycle from DO pin. During this high voltage cycle (busy state), the device does not receive any command.

4. WRITE ALL CYCLE TIMING

Fig.-14 Write All Cycle Timing

○ This command writes 16 bits of data into the all address.

It takes maximum 5ms, because all the data are written in to memory array at the same time.

5.WRITE DISABLE CYCLE TIMING

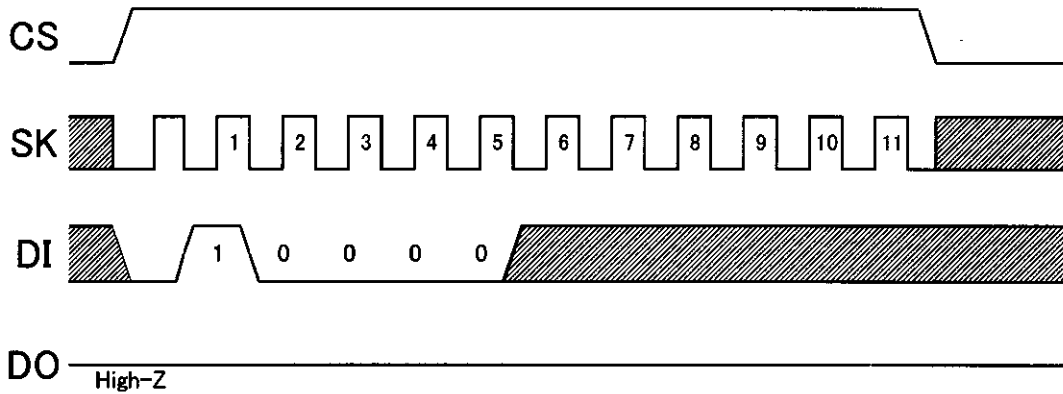

Fig.-15 Write Disable Cycle Timing

- This command put the device into the disable mode.
- After the power on, the device is also in the disable mode.
- The “Read” command can be proceeded even in the disable mode.
- We recommend this “Write Disable” command execution after any write commands in order to prevent inadvertent write. This device does not matter the state (“H” or “L”) of DI after the 6th clock of SK. Please keep inputting six more SK signals.

6.ERASE CYCLE TIMING

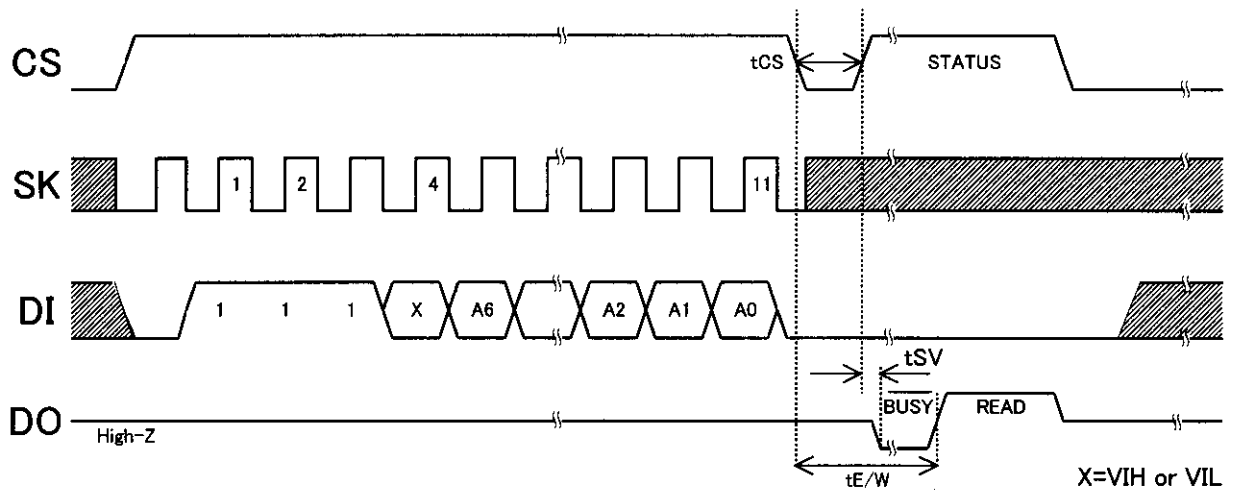

Fig.-16 Erase Cycle Timing

- This “Erase” command writes all bits in the specified address to “1”.
- The falling edge of CS after the 11th clock initiates high voltage cycle, which writes the data into non-volatile memory array.
- The DO pin indicates the Ready/Busy status of the device.

7. ERASE ALL CYCLE TIMING (ERAL)

Fig.-17 Erase All Cycle Timing

○ This “Erase All” command writes all bits in the all address to “1”.

The falling edge of CS after the 11th clock initiates high voltage cycle, which writes the data into non-volatile memory array.

The DO pin indicates the Ready/ $\overline{\text{Busy}}$ status of the device.

◇READY/ $\overline{\text{BUSY}}$ Status (DO pin)

After the write commands input, CS goes low to initiate high voltage cycle and goes high again. Then Ready/ $\overline{\text{Busy}}$ signal will be shown on the DO pin.

$\text{R}/\overline{\text{B}} = \text{Low}$: under writing

After spending $t_{E/W}$ (Max. 5ms) operating the internal timer, the device automatically finishes writing.

During $t_{E/W}$, the memory array is accessed and any instruction is not received.

$\text{R}/\overline{\text{B}} = \text{High}$: ready

Auto programming has been completed. The device is ready to receive the next instruction without waiting $t_{E/W}$. In this case, keep $\text{DI} = \text{L}$ during CS is High.

- ※ During this high voltage cycle (busy state), the device does not receive any command. During the device is ready to next receive command (ready state), it is possible to make malfunction or inadvertent write when the device receives any signals.

Fig.-18 READY/ $\overline{\text{BUSY}}$ Status Output Timing

This product described in this specification is a strategic product and/or subject to COCOM regulations. It should not be exported without authorization from the appropriate Government authorities.

Application Note

- 8 SPECIAL CHARACTERISTICS

1) COMMAND CANCEL
 OREAD

Fig.1-1 READ CANCEL EFFECTIVE TIMING

• Method of cancel : CS="L"

OWRITE, WRAL(Write All)

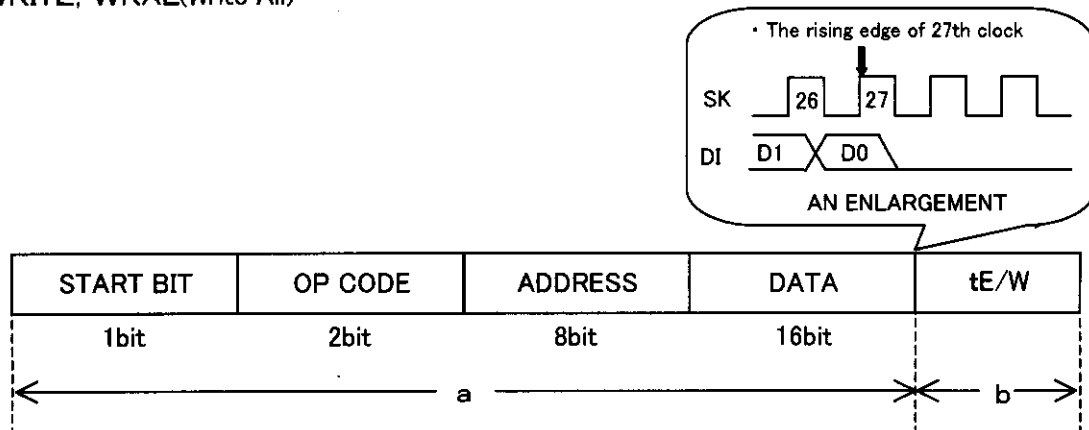

Fig.1-2 WRITE AND WRAL CANCEL EFFECTIVE TIMING

a : The period from start bit to the rising edge of 27th clock
 CS = "L" cancels these commands.

b : The Period from the rising edge of 27th clock to the end of internal write cycle (tE/W)
 There is no way to cancel this command.

If power is down during this period, the data is not guaranteed, so that write correct data again please.

It is impossible to cancel this command by sending additional SK clock signal.

○ERASE, ERAL(Erase All)

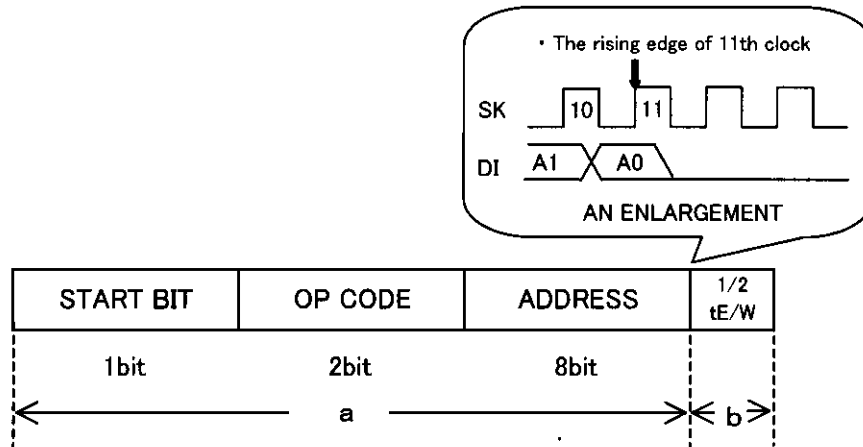

Fig.1-3 ERASE AND ERAL EFFECTIVE TIMING

a : The period from start bit to the rising edge of 11th clock
 CS = "L" cancels these commands.

b : The period from the rising edge of 11th clock to the end of internal write cycle (tE/W)
 There is no way to cancel this command.
 If power is down during this period, the data is not guaranteed, so that write correct data again please.
 It is impossible to cancel this command by sending additional SK clock signal.

2) STAND BY

○STANDBY CURRENT

CS="L" makes standby current constant. SK and DI states do not affect it.

○TIMING (Start Bit)

Data may be inputted if CS is brought high when SK="H" states, as shown Fig.2-1.(See Fig.2-1)
 Please keep SK and DI input signals "L", if CS is brought high during stand by and power ON/OFF.
 (See Fig.2-2)

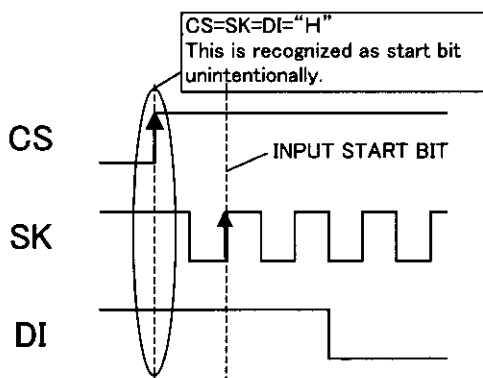

Fig.2-1 NOT PROPOSED TIMING

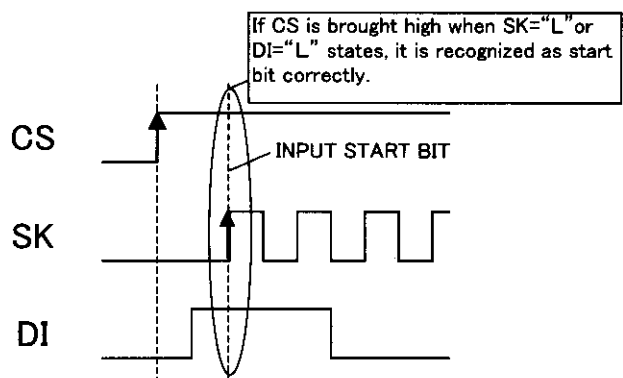

Fig.2-2 PROPER TIMING

3) POWER ON/OFF

- Please keep CS "L" during power ON/OFF.

The device is an active state during CS is high. The extraordinary function or data collaption may occur because of noise etc., if power-up is done with CS "H". In order to prevent above errors from happening, keep CS "L" during power ON. (The device does not receive any command during CS is low.)

It may continue at low Vcc by capacitance of Vcc line during power off. Please keep CS "L" during power off because of the device may make malfunction and inadvertent write.

Fig.3-1 CS TIMING DURING POWER ON/OFF

(Bad example) CS follows Vcc. (CS is pull up to Vcc)

CS is always high in this case the noise may force the device to malfunction and inadvertent write.
✖It may occur even if CS is High-Z.

(Good example) CS is low during power ON/OFF.

Please take more than 10ms between power ON and power OFF, or the internal circuit is not always reset.

OP.O.R. CIRCUIT

In order to prevent an inadvertent write, the device has the feature of P.O.R..

After the power is on, the device is in the write disable mode. P.O.R. works only during power up.

The noise may force the device to make the write enable mode with CS="H" during power ON/OFF.

In the case of power up, keep the following conditions to ensure function of P.O.R.

1. It is necessary to be CS "L"
2. Follow the recommended conditions of t_R , t_{OFF} , V_{bot} for the function of P.O.R. during power up.

Fig.3-2 Vcc wave form

Recommended conditions of t_R , t_{OFF} , V_{bot}

| t_R | t_{OFF} | V_{bot} |
|-------------|------------|------------|
| Below 10ms | Above 10ms | Below 0.3V |
| Below 100ms | Above 10ms | Below 0.2V |

OLVCC CIRCUIT

LVCC (V_{cc} -Lock out) circuit inhibits write operation at low voltage, and prevents an inadvertent write.

When V_{cc} is below the LVCC voltage ($T_{yp.}=1.2V$), write operation is inhibited.

4) NOISE

○ NOISE ON V_{CC} (about bypass capacitor)

Noise and surges on power line may cause the abnormal function. It is recommended that the bypass capacitor (0.1 μF) are attached on the V_{CC} and GND line beside the device.

The attachment of bypass capacitor on the board near by connector is recommended.

Fig.4 NOISE ON V_{CC} COUNTERMEASURE EXAMPLE

○ NOISE ON SK

If SK line has a lot of noise and rising time of SK is long, the device may recognize noise as a clock. Therefore this device has a schmitt trigger (about 0.2V) on SK pin. However to get rid of noise, less than 100ns of SK rising time (t_R) is recommended. If SK rising time is more than 100ns, pay attention to reduce the noise, please.

Please keep rising time and falling time as short as possible to ensure data transfer reliability.

5) INPUT/OUTPUT PIN EQUIVALENT CIRCUIT
 OOUTPUT CIRCUIT

Fig.5-1 DO PIN EQUIVALENT CIRCUIT

OINPUT CIRCUIT

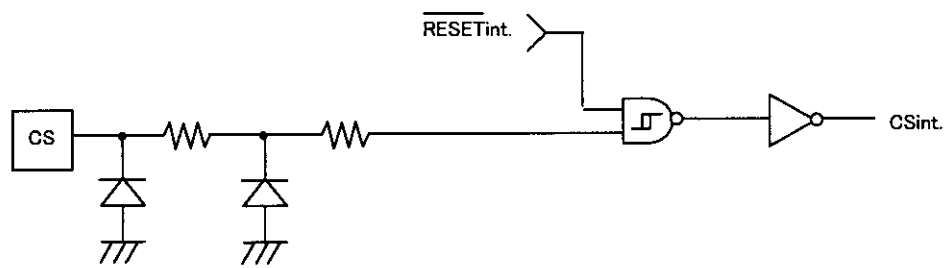

Fig.5-2 CS PIN EQUIVALENT CIRCUIT

Fig.5-3 SK PIN EQUIVALENT CIRCUIT

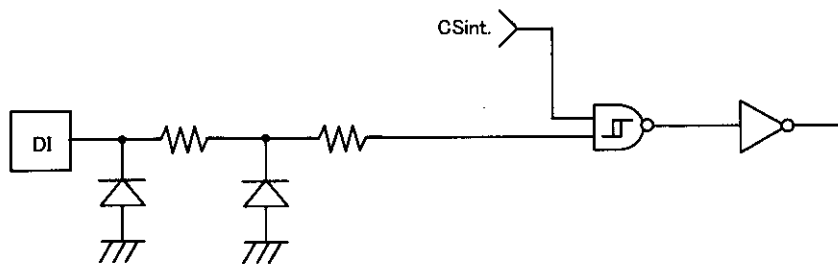

Fig.5-4 DI PIN EQUIVALENT CIRCUIT

6) I/O APPLICATION CIRCUIT

1. Pull down resistor is recommended.

When CS is "L" during power ON/OFF, error operating and writing is protected.

○ PULL DOWN RESISTER OF CS PIN

The pull down resistor is needed in order to prevent error operating and writing from happening. Decide the value of this resistor (R_{pd}) properly, considering VO_{HM} , IO_{HM} characteristics of controller.

$$R_{pd} \geq \frac{VO_{HM}}{IO_{HM}} \dots \textcircled{1}$$

$$VO_{HM} \geq VI_{HE} \dots \textcircled{2}$$

Example) When $V_{CC}=5V, VI_{HE}=2V, VO_{HM}=2.4V, IO_{HM}=2mA$, According to $\textcircled{1}$,

$$R_{pd} \geq \frac{2.4}{2 \times 10^{-3}}$$

$$\therefore R_{pd} \geq 1.2[k\Omega]$$

If the R_{pd} is under the conditions of the equation $\textcircled{1}$, VO_{HM} is 2.4V or more.

If the R_{pd} is under the conditions of the equation $\textcircled{2}$, $VI_{HE}(=2.0V)$ is VO_{HM} or less.

Fig.6-1 PULL DOWN RESISTER OF CS PIN

- VI_{HE} : VI_H specification of EEPROM
- VO_{HM} : VO_H specification of CONTROLLER
- IO_{HM} : IO_H specification of CONTROLLER

2. DO may have either pull up and down.

DO is "High-Z" except output data and R/\bar{B} status timing. If the controller make malfunction with state "High-Z", it is needed the pull up or down resistor to DO. If the state of DO pin do not affect it, the DO pin may be left "High-Z".

In case that the DO pin is no connection, if CS, SK and DI is high during DO states ready, the device recognize it as a start bit and cancel state ready. DO looks "H" by the pull up resistor of DO. (See Fig.6-2)

Fig.6-2 READY OUTPUT TIMING WHEN DO IS OPEN

OPULL UP/DOWN RESISTER OF DO PIN

Decide the value of this resistor (R_{pu}) properly, by considering V_{IH}, V_{IL} characteristics of a controller, which control the device and V_{OH}, I_{OH}, V_{OL}, I_{OL} characteristics of the device.

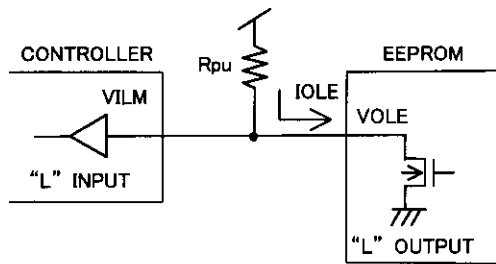

Fig.6-3 PULL UP RESISTER OF DO PIN

$$R_{pu} \geq \frac{V_{cc}-V_{OLE}}{I_{OLE}} \dots \textcircled{3}$$

$$V_{OLE} \leq V_{ILM} \dots \textcircled{4}$$

Example) When V_{cc}=5V, V_{OLE}=0.4V, I_{OLE}=2.1mA, V_{ILM}=0.8V, According to ③

$$R_{pu} \geq \frac{5-0.4}{2.1 \times 10^{-3}}$$

$$\therefore R_{pu} \geq 2.2[k\Omega]$$

If the R_{pu} is under the conditions of the equation ③, V_{OLE} is 0.4V or less.

If the R_{pu} is under the conditions of the equation ④, V_{ILM}(=0.8V) is V_{OLE} or more.

- V_{OLE}: V_{OL} specification of EEPROM
- I_{OLE}: I_{OL} specification of EEPROM
- V_{ILM}: V_{IL} specification of CONTROLLER

Fig.6-4 PULL DOWN RESISTER OF DO PIN

$$R_{pd} \geq \frac{V_{OHE}}{I_{OHE}} \dots \textcircled{5}$$

$$V_{OHE} \geq V_{IHM} \dots \textcircled{6}$$

Example) When V_{cc}=5V, V_{OHE}=V_{cc}-0.2V, I_{OHE}=0.1mA, V_{IHM}=V_{cc} × 0.7V, According to ⑤

$$R_{pd} \geq \frac{5-0.2}{0.1 \times 10^{-3}}$$

$$\therefore R_{pd} \geq 48[k\Omega]$$

If the R_{pu} is under the conditions of the equation ⑤, V_{OHE} is 2.4V or more.

If the R_{pu} is under the conditions of the equation ⑥, V_{IHM}(=3.5V) is V_{OHE} or less.

- V_{OHE}: V_{OH} specification of EEPROM
- I_{OHE}: I_{OH} specification of EEPROM
- V_{IHM}: V_{IH} specification of CONTROLLER

7) DI/O PORT (TO CONNECT DI AND DO)

The device has DI and DO (independent each other). But they can be connected, then controlled by signal DI/O port. (1 port)

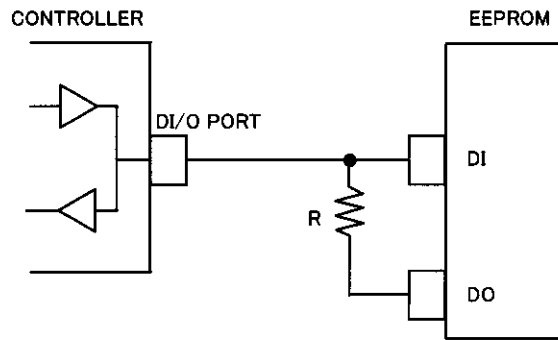

Fig.7-1 DI/O PORT TO CONNECT DI AND DO

OBUS CONNECTION BETWEEN CONTROLLER AND EEPROM (DO FEED BACK TO DI)

There are two timing that has bus conflict between DI/O output and DO.

(1) Half clock cycle for A0 (last address bit) in read mode. (See Fig.7-2)

DO outputs the dummy "0".

→ There are bus contention when A0="1" are inputted.

Fig.7-2 DI/O PORT TO CONNECT DI AND DO READ OPERATION

(2) CS="H" after program command. (See Fig.7-3)

DO outputs READY/BUSY signal, until start bit is inputted.

DO makes "High-Z" states by recognizing a start bit.

→When CS is brought high with controller output "L" from DI/O port during next command input, the device outputs ready signal from DO pin and makes a current overload.

In timing of (1), (2), to insert R between DI and DO will solve above problems.

Fig.7-3 DI/O PORT TO CONNECT DI AND DO DURING WRITE OPERATION

NOTE) In the case of (2), pay attention to the case below, please.

In the case of the device states ready and DI="H" and DI/DO="High-Z" or DI/DO="H", if controller output "H" to SK, the device may be recognized as start bit unintentional and occur malfunction. Keep SK="L" during DO output READY, please.

OR

Bring CS "L" within 4 clock cycle after READY/BUSY signal turn to "H", please. (See Fig.7-4)

Because of DI="H", SK input need to be "L" when CS is brought high

Fig.7-4 RECOMMENDED TIMING DURING DO OUTPUTS READY

VALUE OF RESISTER

"R" is current limit resistor during conflict on the bus. The current overload may cause noises on the power line and instantaneous power down.

The following conditions must be met, where "I" is the maximum permissible current. The maximum permissible current depends on Vcc line impedance and so on.

Value of "R" need to be decided to meet VIH/VIL specification of EEPROM even if there are some leakage current. The insert on "R" does not make any problem for function.

- (1) When the device receives DI="1"(A0="1") and outputs DO="0"(dummy="0")
 (CONTROLLER "H" OUTPUT, EEPROM: DO="L" OUTPUT, DI="H" INPUT)
- IOHM needs to be less than 10mA for EEPROM.
 - VOHM needs to be less than VIHE as following.

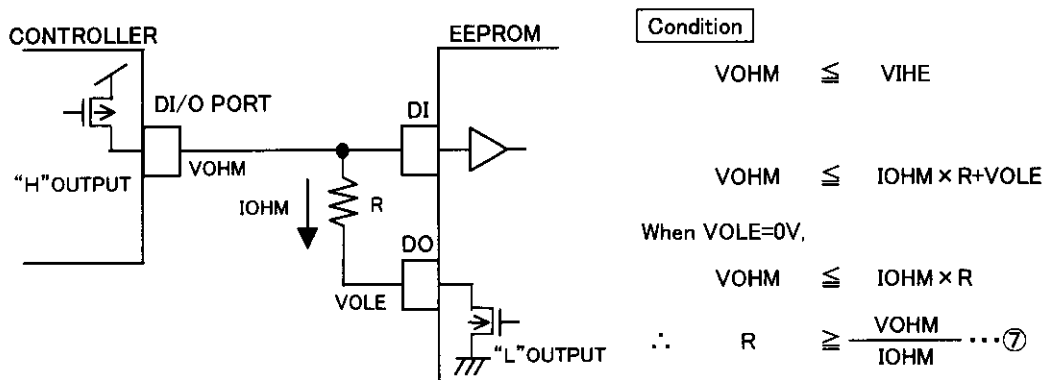

Fig.7-5 DI/O PORT TO CONNECT DI AND DO
 (CONTROLLER "H" OUTPUT,
 EEPROM "L" OUTPUT)

- (2) When DO state is "H"(READY)
 (CONTROLLER "L" OUTPUT, EEPROM: DO="H" OUTPUT, DI="L" INPUT)
- VOLM needs to be less than VILE as following.

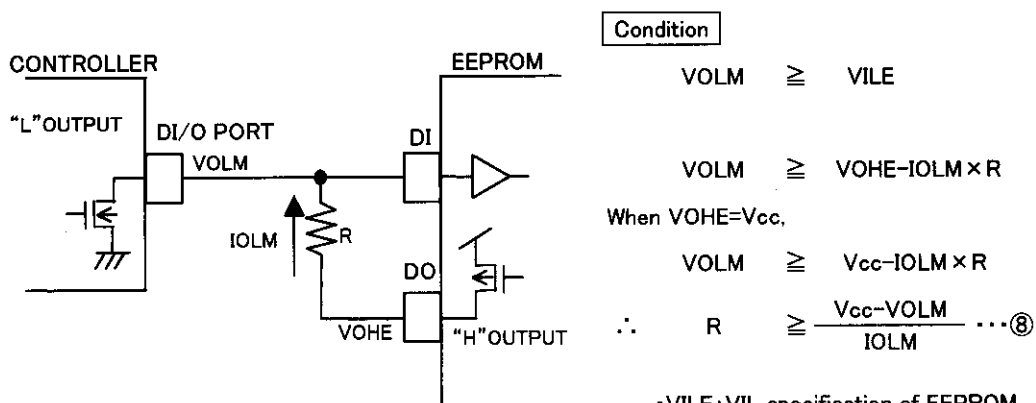

Fig.7-6 DI/O PORT TO CONNECT DI AND DO
 (CONTROLLER "L" OUTPUT,
 EEPROM "H" OUTPUT)

Example) When $V_{CC}=5V$, $V_{OHM}=5V$, $I_{OHM}=0.4mA$, $V_{OLM}=5V$, $I_{OLM}=0.4mA$,
According to ⑦,

$$R \geq \frac{V_{OHM}}{I_{OHM}}$$

$$R \geq \frac{5}{0.4 \times 10^{-3}}$$

$$\therefore R \geq 12.5[k\Omega] \quad \dots \textcircled{9}$$

According to ⑧,

$$R \geq \frac{V_{CC}-V_{OLM}}{I_{OLM}}$$

$$R \geq \frac{5-0.4}{2.1 \times 10^{-3}}$$

$$\therefore R \geq 2.2[k\Omega] \quad \dots \textcircled{10}$$

According to ⑨,⑩

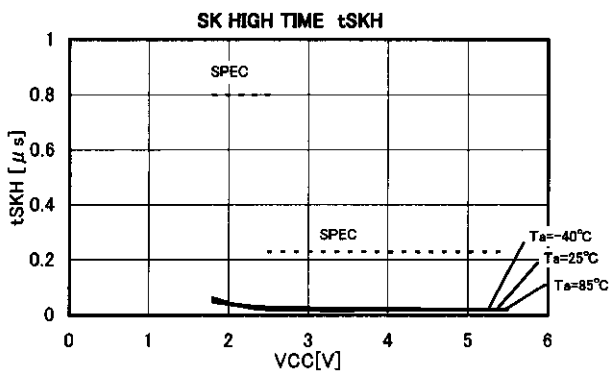

$$\therefore R \geq 12.5[k\Omega]$$

8) SPECIAL CHARACTERISTICS

The following characteristics data are typical value.

Notes

- No technical content pages of this document may be reproduced in any form or transmitted by any means without prior permission of ROHM CO.,LTD.
- The contents described herein are subject to change without notice. The specifications for the product described in this document are for reference only. Upon actual use, therefore, please request that specifications to be separately delivered.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resell or otherwise dispose of the same, no express or implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by
- ROHM CO., LTD. is granted to any such buyer.
- Products listed in this document use silicon as a basic material.
Products listed in this document are no antiradiation design.

The products listed in this document are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys).

Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.

About Export Control Order in Japan

Products described herein are the objects of controlled goods in Annex 1 (Item 16) of Export Trade Control Order in Japan.

In case of export from Japan, please confirm if it applies to "objective" criteria or an "informed" (by MITI clause) on the basis of "catch all controls for Non-Proliferation of Weapons of Mass Destruction.
