## Baseband Sound Processor

**Release Notes:** The hardware description in this document is valid for the BSP 3505D version A2.

### 1. Introduction

The **BSP 3505D** is designed as a single-chip Baseband Sound Processor for applications in analog and digital TV sets, video recorders, and satellite receivers.

The IC is produced in submicron CMOS technology, and is fully pin and software compatible to the MSP 34xx family. The BSP 3505D is available in a PLCC68, PSDIP64, PSDIP52, PQFP80, and in a PQFP44 package.

**Note:** The BSP 3505D version has reduced control registers and less functional pins. The remaining registers are software compatible to the MSP 34xxD. The pinning is compatible to the MSP 34xxD.

#### 1.1. BSP 3505D Integrated Functions

- Stereo baseband input via integrated A/D converters
- Two stereo D/A converters
- AVC: Automatic Volume Correction
- Bass, treble, volume, loudness processing
- Full SCART in/out matrix without restrictions
- spatial effect (pseudostereo / basewidth enlargement)
- Digital control output pins D\_CTR\_OUT0/1
- Reduction of necessary controlling
- Less external components

### 1.2. Features of the DSP-Section

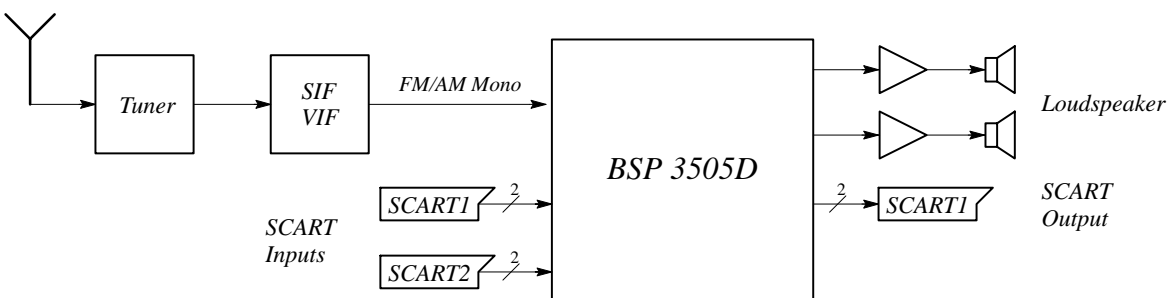

- flexible selection of audio sources to be processed
- digital baseband processing: volume, bass, treble, loudness, and spatial effects
- simple controlling of volume, bass, treble, loudness, and spatial effects

### 1.3. Features of the Analog Section

- two selectable analog stereo audio baseband inputs (= two SCART inputs)  
input level:  $\leq 2$  V RMS,  
input impedance:  $\geq 25$  k $\Omega$
- one selectable analog mono input:  
input level:  $\leq 2$  V RMS,  
input impedance:  $\geq 15$  k $\Omega$
- stereo high-quality A/D converter, S/N-Ratio:  $\geq 85$  dB
- 20 Hz to 20 kHz bandwidth for SCART-to-SCART-copy facilities
- loudspeaker: stereo four-fold oversampled D/A-converter  
output level per channel: max. 1.4 VRMS  
output resistance: max. 5 k $\Omega$   
S/N-ratio:  $\geq 85$  dB at maximum volume  
max. noise voltage in mute mode:  $\leq 10$   $\mu$ V (BW: 20 Hz ... 16 kHz)
- stereo four-fold oversampled D/A converter supplying a stereo SCART-output  
output level per channel: max. 2 V RMS,  
output resistance: max. 0.5 k $\Omega$ ,  
S/N-Ratio:  $\geq 85$  dB (20 Hz... 16 kHz)

**Fig. 1–2:** Main I/O Signals BSP 3505D

**Fig. 1–1:** Typical BSP 3505D application

## 2. Architecture of the BSP 3505D

Fig. 2–2 shows a simplified block diagram of the IC. Its architecture is split into two main functional blocks:

1. DSP (digital signal processing) section performing audio baseband processing
2. analog section containing two A/D-converters, four D/A-converters, and SCART-switching facilities.

### 2.1. Analog Section and SCART Switching Facilities

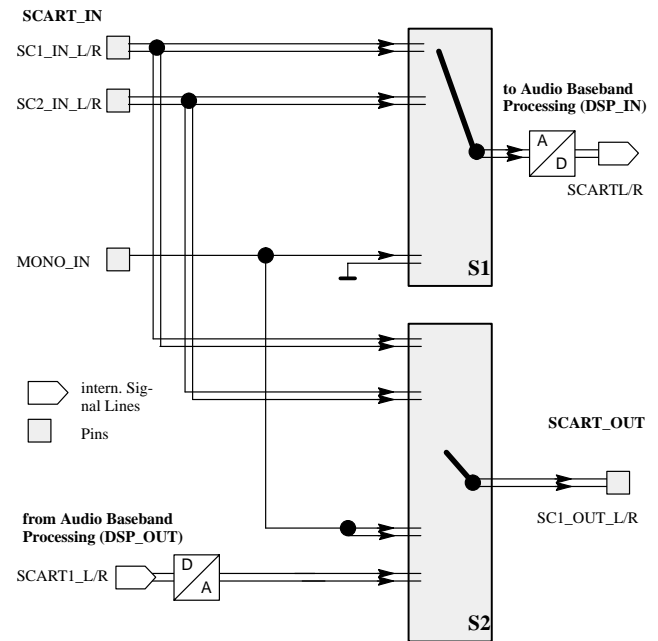

The analog input and output sections include full matrix switching facilities, which are shown in Fig. 2–1.

The switches are controlled by the ACB bits defined in the audio processing interface (see section 4. Programming the BSP 3505D).

#### 2.1.1. Standby Mode

If the BSP 3505D is switched off by first pulling **STANDBYQ** low, and then disconnecting the 5 V, but keeping the 8 V power supply (**'Standby'-mode**), the switches **S1** and **S2** (see Fig. 2–1) maintain their position and function. This facilitates the copying from selected SCART-inputs to SCART-output in the TV-set's standby mode.

In case of power-on start or starting from standby, the IC switches automatically to the default configuration, shown in Fig. 2–1. This action takes place after the first I<sup>2</sup>C transmission into the DSP part. By transmitting the **ACB** register first, the individual default setting mode of the TV set can be defined.

**Fig. 2–1:** SCART-Switching Facilities (see 4.4.12.) positions show the default configuration after Power On Reset.

**Note:** SCART\_OUT is undefined after RESET!

**Fig. 2–2:** Architecture of the BSP 3505D

2.2. BSP 3505D Audio Baseband Processing

All audio baseband functions are performed by digital signal processing (DSP). The DSP functions are grouped into three processing parts: input preprocessing, channel source selection, and channel postprocessing (see Fig. 2–3).

The input preprocessing is intended to form a standardized signal level.

All input and output signals can be processed simultaneously.

2.3. Clock and Crystal Specifications

**Remark on using the crystal:** External capacitors at each crystal pin to ground are required. The higher the capacitors, the lower the clock frequency results.

The nominal free running frequency should match the center of the tolerance range between 18.433 and 18.431 MHz as closely as possible.

2.4. Digital Control Output Pins

The static level of two output pins of the BSP 3505D (D\_CTR\_OUT0/1) is switchable between HIGH and LOW by means of the I<sup>2</sup>C-bus. This enables the controlling of external hardware controlled switches or other devices via I<sup>2</sup>C-bus (see section 4.4.11.)

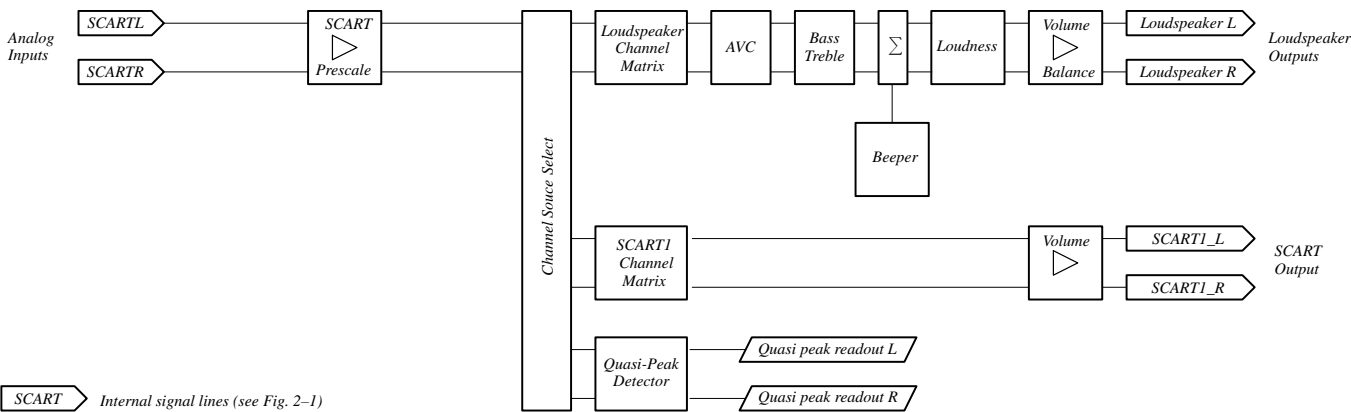

Fig. 2–3: Audio Baseband Processing (DSP-Firmware)

### 3. I<sup>2</sup>C Bus Interface: Device and Subaddresses

As a slave receiver, the BSP 3505D can be controlled via I<sup>2</sup>C bus. Access to internal memory locations is achieved by subaddressing. The DSP processor part has its own subaddressing register bank.

In order to allow for more BSP or MSP ICs to be connected to the control bus, an ADR\_SEL pin has been implemented. With ADR\_SEL pulled to high, low, or left open, the BSP 3505D responds to changed device addresses. Thus, three identical devices can be selected.

By means of the RESET bit in the CONTROL register, all devices with the same device address are reset.

The IC is selected by asserting a special device address in the address part of an I<sup>2</sup>C transmission. A device address pair is defined as a write address (80, 84, or 88<sub>hex</sub>) and a read address (81, 85, or 89<sub>hex</sub>). Writing is done by sending the device write address first, followed by the subaddress byte, two address bytes, and two data bytes. Reading is done by sending the device write address, followed by the subaddress byte and two address bytes. Without sending a stop condition, reading of the addressed data is completed by sending the device read address (81, 85, or 89<sub>hex</sub>) and reading two bytes of data.

Refer to Fig. 3–1: I<sup>2</sup>C Bus Protocol and section 3.2. Proposal for BSP 3505D I<sup>2</sup>C Telegrams.

Due to the internal architecture of the BSP 3505D the IC cannot react immediately to an I<sup>2</sup>C request. The typical response time is about 0.3 ms for the DSP processor part. If the receiver (BSP) can't receive another complete byte of data until it has performed some other function; for example, servicing an internal interrupt, it can hold the clock line I<sup>2</sup>C\_CL LOW to force the transmitter into a wait state. The positions within a transmission where this may happen are indicated by 'Wait' in section 3.1. The maximum Wait-period of the BSP during normal operation mode is less than 1 ms.

I<sup>2</sup>C-Bus conditions caused by BSP hardware problems: In case of any internal error, the BSPs wait-period is extended to 1.8 ms. Afterwards, the BSP does not acknowledge (NAK) the device address. The data line will be left HIGH by the BSP and the clock line will be released. The master can then generate a STOP condition to abort the transfer.

By means of NAK, the master is able to recognize the error state and to reset the IC via I<sup>2</sup>C-Bus. While transmitting the reset protocol (s. 5.2.4.) to 'CONTROL', the master must ignore the not acknowledge bits (NAK) of the BSP.

A general timing diagram of the I<sup>2</sup>C Bus is shown in Fig. 3–2.

**Table 3–1: I<sup>2</sup>C Bus Device Addresses**

ADR_SEL	Low		High		Left Open	
Mode	Write	Read	Write	Read	Write	Read
BSP device address	80 <sub>hex</sub>	81 <sub>hex</sub>	84 <sub>hex</sub>	85 <sub>hex</sub>	88 <sub>hex</sub>	89 <sub>hex</sub>

**Table 3–2: I<sup>2</sup>C Bus Subaddresses**

Name	Binary Value	Hex Value	Mode	Function
CONTROL	0000 0000	00	Write	software reset
TEST	0000 0001	01	Write	only for internal use
WR_DSP	0001 0010	12	Write	write address DSP
RD_DSP	0001 0011	13	Write	read address DSP

Table 3–3: Control Register (Subaddress: 00<sub>hex</sub>)

Name	Subaddress	MSB	14	13..1	LSB
CONTROL	00 <sub>hex</sub>	1 : RESET 0 : normal	0	0	0

3.1. Protocol Description

Write to DSP

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	data-byte high	ACK	data-byte low	ACK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	----------------	-----	---------------	-----	---

Read from DSP

S	write device address	Wait	ACK	sub-addr	ACK	addr-byte high	ACK	addr-byte low	ACK	S	read device address	Wait	ACK	data-byte high	ACK	data-byte low	NAK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	---	---------------------	------	-----	----------------	-----	---------------	-----	---

Write to Control or Test Registers

S	write device address	Wait	ACK	sub-addr	ACK	data-byte high	ACK	data-byte low	ACK	P
---	----------------------	------	-----	----------	-----	----------------	-----	---------------	-----	---

**Note:** S = I<sup>2</sup>C-Bus Start Condition from master  
P = I<sup>2</sup>C-Bus Stop Condition from master  
ACK = Acknowledge-Bit: LOW on I<sup>2</sup>C\_DA from slave (=BSP, gray) or master (=CCU, hatched)  
NAK = Not Acknowledge-Bit: HIGH on I<sup>2</sup>C\_DA from master (=CCU, hatched) to indicate ‘End of Read’ or from BSP indicating internal error state  
Wait = I<sup>2</sup>C-Clock line held low by the slave (=BSP) while interrupt is serviced (<1.8 ms)

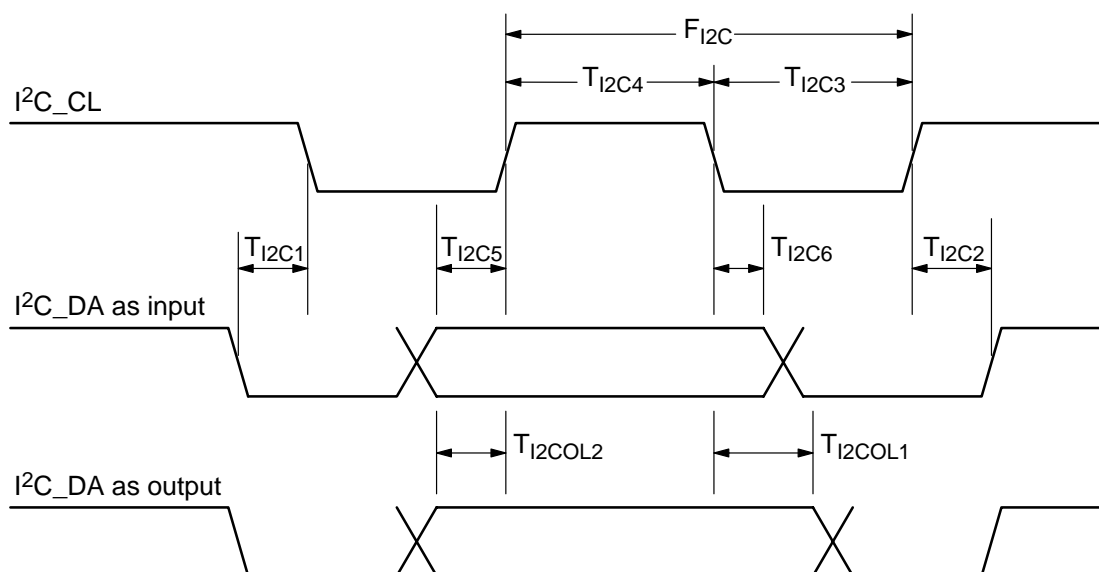

Fig. 3–1: I<sup>2</sup>C bus protocol (MSB first; data must be stable while clock is high)

(Data: MSB first)

**Fig. 3–2:** I²C bus timing diagram

## 3.2. Proposal for BSP 3505D I²C Telegrams

### 3.2.1. Symbols

daw write device address  
 dar read device address  
 < Start Condition  
 > Stop Condition  
 aa Address Byte  
 dd Data Byte

### 3.2.2. Write Telegrams

<daw 00 d0 00> write to CONTROL register  
 <daw 12 aa aa dd dd> write data into DSP

### 3.2.3. Read Telegrams

<daw 13 aa aa <dar dd dd> read data from DSP

### 3.2.4. Examples

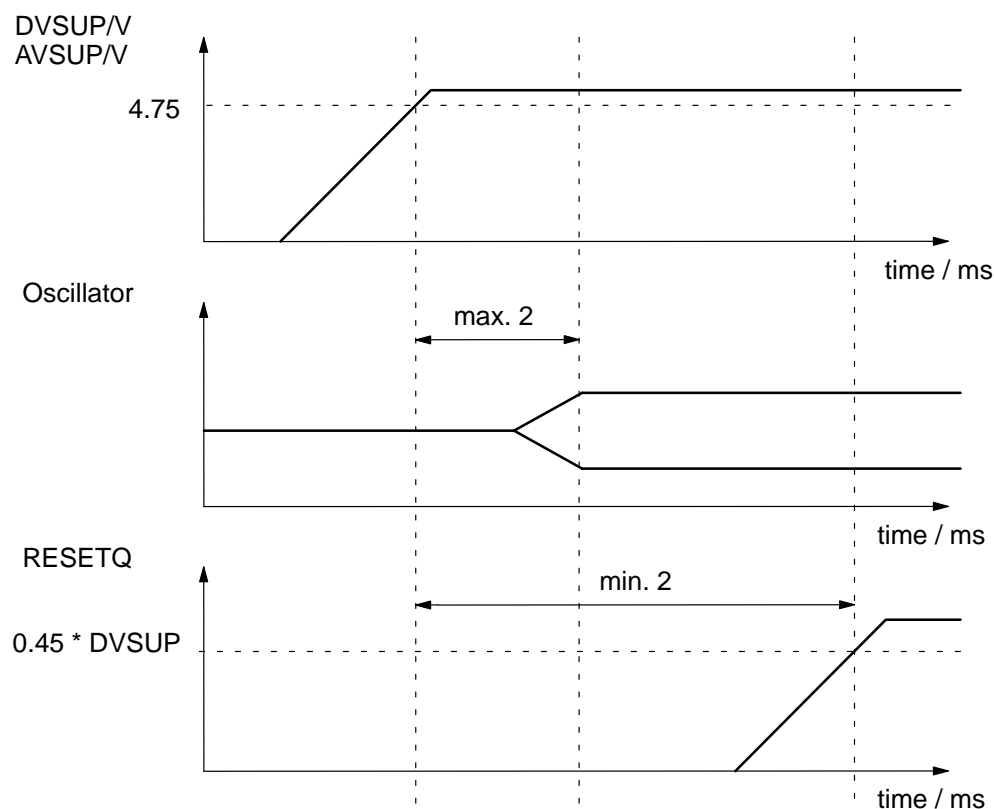

<80 00 80 00> RESET BSP statically  
 <80 00 00 00> clear RESET  
 <80 12 00 08 02 20> set loudspeaker channel source  
 to SCART, stereo

### 3.3. Start Up Sequence: Power Up and I<sup>2</sup>C-Controlling

After power on or RESET (see Fig. 3–3), the IC is in an inactive state. The CCU has to transmit the required coefficient set for a given operation via the I<sup>2</sup>C bus. Initialization must start with the MODE Register.

The reset pin should not be  $>0.45 \cdot \text{DVSUP}$  (see recommended conditions) before the 5 Volt digital power supply (DVSUP) and the analog power supply (AVSUP) are  $>4.75$  Volt **AND** the BSP clock is running. (Delay: 0.5 ms typ, 2 ms max)

This means, if the reset low–high edge starts with a delay of 2 ms after DVSUP and AVSUP  $>4.75$  Volt, even under worst case conditions, the reset is ok.

**Fig. 3–3:** Power-up sequence

**Note:** The reset should not reach high level before the oscillator has started. This requires a reset delay of  $>2$  ms

## 4. Programming the BSP 3505D

### 4.1. Register 'MODE\_REG'

The register 'MODE\_REG' contains the control bits determining the operation mode of the BSP 3505D; Table 4–1 explains all bit positions.

**Table 4–1:** Control word 'MODE\_REG': All bits are "0" after power-on-reset

Register	Protocol	Write Address (hex)	Function
MODE_REG	long	0083	mode register
Bit	Function	Comment	Definition
[0]	not used		must be 0
[1]	DCTR_TRI	Digital_Control_Output tristate	0 : active 1 : tristate
[2]	not used		must be 1
[3–4]	not used		must be 0
[5]	not used		must be 1
[6–9]	not used		must be 0
[10–15]	not used		must be 0

## 4.2. DSP Write Registers: Table and Addresses

**Table 4–2:** DSP Write Registers; Subaddress: 12<sub>hex</sub>; if necessary these registers are readable as well.

DSP Write Register	Address	High/Low	Adjustable Range, Operational Modes	Reset Mode
Volume loudspeaker channel	0000 <sub>hex</sub>	H	[+12 dB ... –114 dB, MUTE]	MUTE
Volume / Clipping Mode loudspeaker		L	1/8 dB Steps / Reduce Vol., Tone, Comprom.	00 <sub>hex</sub>
Balance loudspeaker channel [L/R]	0001 <sub>hex</sub>	H	[0..100 / 100 % and vv][–127..0 / 0 dB and vv]	100%/100%
Balance Mode loudspeaker		L	[Linear mode / logarithmic mode]	linear mode
Bass loudspeaker channel	0002 <sub>hex</sub>	H	[+12 dB ... –12 dB]	0 dB
Treble loudspeaker channel	0003 <sub>hex</sub>	H	[+12 dB ... –12 dB]	0 dB
Loudness loudspeaker channel	0004 <sub>hex</sub>	H	[0 dB ... +17 dB]	0 dB
Loudness Filter Characteristic		L	[NORMAL, SUPER_BASS]	NORMAL
Spatial effect strength loudspeaker ch.	0005 <sub>hex</sub>	H	[–100%...OFF...+100%]	OFF
Spatial effect mode/customize		L	[SBE, SBE+PSE]	SBE+PSE
Volume SCART1 channel	0007 <sub>hex</sub>	H	[00 <sub>hex</sub> ... 7F <sub>hex</sub> ],[+12 dB ... –114 dB, MUTE]	00 <sub>hex</sub>
Volume / Mode SCART1 channel		L	[Linear mode / logarithmic mode]	linear mode
Loudspeaker channel source	0008 <sub>hex</sub>	H	[SCART]	FM/AM
Loudspeaker channel matrix		L	[SOUNDA, SOUNDB, STEREO, MONO]	SOUNDA
SCART1 channel source	000A <sub>hex</sub>	H	[SCART]	FM/AM
SCART1 channel matrix		L	[SOUNDA, SOUNDB, STEREO, MONO]	SOUNDA
Quasi-peak detector source	000C <sub>hex</sub>	H	[SCART]	FM/AM
Quasi-peak detector matrix		L	[SOUNDA, SOUNDB, STEREO, MONO]	SOUNDA
Prescale SCART	000D <sub>hex</sub>	H	[00 <sub>hex</sub> ... 7F <sub>hex</sub> ]	00 <sub>hex</sub>
ACB Register (SCART Switching Facilities)	0013 <sub>hex</sub>	H/L	Bits [15..0]	00 <sub>hex</sub>
Beeper	0014 <sub>hex</sub>	H/L	[00 <sub>hex</sub> ... 7F <sub>hex</sub> ]/[00 <sub>hex</sub> ... 7F <sub>hex</sub> ]	0/0
Automatic Volume Correction	0029 <sub>hex</sub>	H	[off, on, decay time]	off

## 4.3. DSP Read Registers: Table and Addresses

**Table 4–3:** DSP Read Registers; Subaddress: 13<sub>hex</sub>

DSP Read Register	Address	High/Low	Output Range
Quasi peak readout left	0019 <sub>hex</sub>	H&L	[00 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] 16 bit two's complement
Quasi peak readout right	001A <sub>hex</sub>	H&L	[00 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] 16 bit two's complement

#### 4.4. DSP Write Registers: Functions and Values

Write registers are 16 bit wide, whereby the MSB is denoted bit [15]. Transmissions via I<sup>2</sup>C bus have to take place in 16-bit words. Some of the defined 16-bit words are divided into low [7..0] and high [15..8] byte, or in an other manner, thus holding two different control entities. All write registers are readable. Unused parts of the 16-bit registers must be zero. Addresses not given in this table must not be written at any time!

##### 4.4.1. Volume Loudspeaker Channel

Volume Loudspeaker	0000 <sub>hex</sub>	[15..4]
+12 dB	0111 1111 0000	7F0 <sub>hex</sub>
+11.875 dB	0111 1110 1110	7EE <sub>hex</sub>
+0.125 dB	0111 0011 0010	732 <sub>hex</sub>
0 dB	0111 0011 0000	730 <sub>hex</sub>
-0.125 dB	0111 0010 1110	72E <sub>hex</sub>
-113.875 dB	0000 0001 0010	012 <sub>hex</sub>
-114 dB	0000 0001 0000	010 <sub>hex</sub>
Mute	0000 0000 0000	000 <sub>hex</sub> RESET
Fast Mute	1111 1111 1110	FFE <sub>hex</sub>

The highest given positive 8-bit number (7F<sub>hex</sub>) yields in a maximum possible gain of 12 dB. Decreasing the volume register by 1 LSB decreases the volume by 1 dB. Volume settings lower than the given minimum mute the output. With large scale input signals, positive volume settings may lead to signal clipping.

The BSP 3505D loudspeaker volume function is divided up in a digital and an analog section.

With Fast Mute, volume is reduced to mute position by digital volume only. Analog volume is not changed. This reduces any audible DC plops. Going back from Fast Mute should be done to the volume step before Fast Mute was activated.

Clipping Mode Loudspeaker	0000 <sub>hex</sub>	[3..0]
Reduce Volume	0000 RESET	0 <sub>hex</sub>
Reduce Tone Control	0001	1 <sub>hex</sub>
Compromise Mode	0010	2 <sub>hex</sub>

If the clipping mode is set to “Reduce Volume”, the following clipping procedure is used: To prevent severe clipping effects with bass or treble boosts, the internal volume is automatically limited to a level where, in combination with either bass or treble setting, the amplification does not exceed 12 dB.

If the clipping mode is “Reduce Tone Control”, the bass or treble value is reduced if amplification exceeds 12 dB.

If the clipping mode is “Compromise Mode”, the bass or treble value and volume are reduced half and half if amplification exceeds 12 dB.

Example:	Vol.: +6 dB	Bass: +9 dB	Treble: +5 dB
Red. Volume	3	9	5
Red. Tone Con.	6	6	5
Compromise	4.5	7.5	5

#### 4.4.2. Balance Loudspeaker Channel

Positive balance settings reduce the left channel without affecting the right channel; negative settings reduce the right channel leaving the left channel unaffected. In linear mode, a step by 1 LSB decreases or increases the balance by about 0.8% (exact figure: 100/127). In logarithmic mode, a step by 1 LSB decreases or increases the balance by 1 dB.

Balance Mode Loudspeaker	0001 <sub>hex</sub>	[3..0]
linear	0000 RESET	0 <sub>hex</sub>
logarithmic	0001	1 <sub>hex</sub>

Linear Mode		
Balance Loudspeaker Channel [L/R]	0001 <sub>hex</sub>	H
Left muted, Right 100%	0111 1111	7F <sub>hex</sub>
Left 0.8%, Right 100%	0111 1110	7E <sub>hex</sub>
Left 99.2%, Right 100%	0000 0001	01 <sub>hex</sub>
Left 100%, Right 100%	0000 0000 RESET	00 <sub>hex</sub>
Left 100%, Right 99.2%	1111 1111	FF <sub>hex</sub>
Left 100%, Right 0.8%	1000 0010	82 <sub>hex</sub>
Left 100%, Right muted	1000 0001	81 <sub>hex</sub>

Logarithmic Mode		
Balance Loudspeaker Channel [L/R]	0001 <sub>hex</sub>	H
Left -127 dB, Right 0 dB	0111 1111	7F <sub>hex</sub>
Left -126 dB, Right 0 dB	0111 1110	7E <sub>hex</sub>
Left -1 dB, Right 0 dB	0000 0001	01 <sub>hex</sub>
Left 0 dB, Right 0 dB	0000 0000 RESET	00 <sub>hex</sub>
Left 0 dB, Right -1 dB	1111 1111	FF <sub>hex</sub>
Left 0 dB, Right -127 dB	1000 0001	81 <sub>hex</sub>
Left 0 dB, Right -128 dB	1000 0000	80 <sub>hex</sub>

#### 4.4.3. Bass Loudspeaker Channel

Bass Loudspeaker	0002 <sub>hex</sub>	H
+20 dB	0111 1111	7F <sub>hex</sub>
+18 dB	0111 1000	78 <sub>hex</sub>
+16 dB	0111 0000	70 <sub>hex</sub>
+14 dB	0110 1000	68 <sub>hex</sub>
+12 dB	0110 0000	60 <sub>hex</sub>
+11 dB	0101 1000	58 <sub>hex</sub>
+1 dB	0000 1000	08 <sub>hex</sub>
+1/8 dB	0000 0001	01 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>
-1/8 dB	1111 1111	FF <sub>hex</sub>
-1 dB	1111 1000	F8 <sub>hex</sub>
-11 dB	1010 1000	A8 <sub>hex</sub>
-12 dB	1010 0000	A0 <sub>hex</sub>

With positive bass settings, internal overflow may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set bass to a value that, in conjunction with volume, would result in an overall positive gain.

**4.4.4. Treble Loudspeaker Channel**

Treble Loudspeaker	0003 <sub>hex</sub>	H
+15 dB	0111 1000	78 <sub>hex</sub>
+14 dB	0111 0000	70 <sub>hex</sub>
+1 dB	0000 1000	08 <sub>hex</sub>
+1/8 dB	0000 0001	01 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>
−1/8 dB	1111 1111	FF <sub>hex</sub>
−1 dB	1111 1000	F8 <sub>hex</sub>
−11 dB	1010 1000	A8 <sub>hex</sub>
−12 dB	1010 0000	A0 <sub>hex</sub>

With positive treble settings, internal overflow may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set treble to a value that, in conjunction with volume, would result in an overall positive gain.

**4.4.5. Loudness Loudspeaker Channel**

Loudness Loudspeaker	0004 <sub>hex</sub>	H
+17 dB	0100 0100	44 <sub>hex</sub>
+16 dB	0100 0000	40 <sub>hex</sub>
+1 dB	0000 0100	04 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>

Mode Loudness Loudspeaker	0004 <sub>hex</sub>	L
Normal (constant volume at 1 kHz)	0000 0000 RESET	00 <sub>hex</sub>
Super Bass (constant volume at 2 kHz)	0000 0100	04 <sub>hex</sub>

Loudness increases the volume of low and high frequency signals, while keeping the amplitude of the 1 kHz reference frequency constant. The intended loudness has to be set according to the actual volume setting. Because loudness introduces gain, it is not recommended to set loudness to a value that, in conjunction with volume, would result in an overall positive gain.

By means of 'Mode Loudness', the corner frequency for bass amplification can be set to two different values. In Super Bass mode, the corner frequency is shifted up. The point of constant volume is shifted from 1 kHz to 2 kHz.

#### 4.4.6. Spatial Effects Loudspeaker Channel

Spatial Effect Strength Loudspeaker	0005 <sub>hex</sub>	H
Enlargement 100%	0111 1111	7F <sub>hex</sub>
Enlargement 50%	0011 1111	3F <sub>hex</sub>
Enlargement 1.5%	0000 0001	01 <sub>hex</sub>
Effect off	0000 0000 RESET	00 <sub>hex</sub>
Reduction 1.5%	1111 1111	FF <sub>hex</sub>
Reduction 50%	1100 0000	C0 <sub>hex</sub>
Reduction 100%	1000 0000	80 <sub>hex</sub>

Spatial Effect Mode Loudspeaker	0005 <sub>hex</sub>	[7..4]
Stereo Basewidth Enlargement (SBE) and Pseudo Stereo Effect (PSE). (Mode A)	0000 RESET 0000	0 <sub>hex</sub> 0 <sub>hex</sub>
Stereo Basewidth Enlargement (SBE) only. (Mode B)	0010	2 <sub>hex</sub>

Spatial Effect Customize Coefficient Loudspeaker	0005 <sub>hex</sub>	[3..0]
max high pass gain	0000 RESET	0 <sub>hex</sub>
2/3 high pass gain	0010	2 <sub>hex</sub>
1/3 high pass gain	0100	4 <sub>hex</sub>
min high pass gain	0110	6 <sub>hex</sub>
automatic	1000	8 <sub>hex</sub>

There are several spatial effect modes available:

Mode A (low byte = 00<sub>hex</sub>) is compatible to the formerly used spatial effect. Here, the kind of spatial effect depends on the source mode. If the incoming signal is in mono mode, Pseudo Stereo Effect is active; for stereo signals, Pseudo Stereo Effect and Stereo Basewidth Enlargement is effective. The strength of the effect is controllable by the upper byte. A negative value reduces the stereo image. A rather strong spatial effect is recommended for small TV sets where loudspeaker spacing is rather close. For large screen TV sets, a more moderate spatial effect is recommended. In mode A, even in case of stereo input signals, Pseudo Stereo Effect is active, which reduces the center image.

In Mode B, only Stereo Basewidth Enlargement is effective. For mono input signals, the Pseudo Stereo Effect has to be switched on.

It is worth mentioning, that all spatial effects affect amplitude and phase response. With the lower 4 bits, the frequency response can be customized. A value of 0000<sub>bin</sub> yields a flat response for center signals (L = R) but a high pass function of L or R only signals. A value of 0110<sub>bin</sub> has a flat response for L or R only signals but a lowpass function for center signals. By using 1000<sub>bin</sub>, the frequency response is automatically adapted to the sound material by choosing an optimal high pass gain.

## 4.4.7. Volume SCART1

Volume Mode SCART1	0007 <sub>hex</sub>	[3..0]
linear	0000 RESET	0 <sub>hex</sub>
logarithmic	0001	1 <sub>hex</sub>

Linear Mode		
Volume SCART1	0007 <sub>hex</sub>	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0 dB gain (digital full scale (FS) to 2 V <sub>RMS</sub> output)	0100 0000	40 <sub>hex</sub>
+6 dB gain (–6 dBFS to 2 V <sub>RMS</sub> output)	0111 1111	7F <sub>hex</sub>

Logarithmic Mode		
Volume SCART1	0007 <sub>hex</sub>	[15..4]
+12 dB	0111 1111 0000	7F0 <sub>hex</sub>
+11.875 dB	0111 1110 1110	7EE <sub>hex</sub>
+0.125 dB	0111 0011 0010	732 <sub>hex</sub>
0 dB	0111 0011 0000	730 <sub>hex</sub>
–0.125 dB	0111 0010 1110	72E <sub>hex</sub>
–113.875 dB	0000 0001 0010	012 <sub>hex</sub>
–114 dB	0000 0001 0000	010 <sub>hex</sub>
Mute	0000 0000 0000 RESET	000 <sub>hex</sub>

## 4.4.8. Channel Source Modes

Loudspeaker Source	0008 <sub>hex</sub>	H
SCART1 Source	000A <sub>hex</sub>	H
Quasi-Peak Detector Source	000C <sub>hex</sub>	H
NONE (MSP3410: FM)	0000 0000 RESET	00 <sub>hex</sub>
NONE (MSP3410: NICAM)	0000 0001	01 <sub>hex</sub>
SCART	0000 0010	02 <sub>hex</sub>

## 4.4.9. Channel Matrix Modes

Loudspeaker Matrix	0008 <sub>hex</sub>	L
SCART1 Matrix	000A <sub>hex</sub>	L
Quasi-Peak Detector Matrix	000C <sub>hex</sub>	L
SOUNDA / LEFT	0000 0000 RESET	00 <sub>hex</sub>
SOUNDB / RIGHT	0001 0000	10 <sub>hex</sub>
STEREO	0010 0000	20 <sub>hex</sub>
MONO	0011 0000	30 <sub>hex</sub>

## 4.4.10. SCART Prescale

Volume Prescale SCART	000D <sub>hex</sub>	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0 dB gain (2 V <sub>RMS</sub> in- put to digital full scale)	0001 1001	19 <sub>hex</sub>
+14 dB gain (400 mV <sub>RMS</sub> input to digital full scale)	0111 1111	7F <sub>hex</sub>

## 4.4.11. Definition of Digital Control Output Pins

ACB Register	0013 <sub>hex</sub> [15..14]
D_CTR_OUT0 low (RESET) high	x0 x1
D_CTR_OUT1 low (RESET) high	0x 1x

## 4.4.12. Definition of SCART-Switching Facilities

ACB Register	0013 <sub>hex</sub> [13..0]
<b>DSP IN</b> Selection of Source: * SC1_IN_L/R MONO_IN SC2_IN_L/R Mute	xx xx00 xx00 0000 xx xx01 xx00 0000 xx xx10 xx00 0000 xx xx11 xx10 0000
<b>SC1_OUT_L/R</b> Selection of Source: SC2_IN_L/R MONO_IN SCART1 via D/A SC1_IN_L/R Mute	xx 01xx x0x0 0000 xx 10xx x0x0 0000 xx 11xx x0x0 0000 xx 01xx x1x0 0000 xx 11xx x1x0 0000
* = RESET position, which becomes active at the time of the first write transmission on the control bus to the audio processing part (DSP). By writing to the ACB register first, the RESET state can be redefined. <b>Note:</b> After RESET, SC1_OUT_L/R is undefined!	

**Note:** If “MONO\_IN” is selected at the DSP\_IN selection, the channel matrix mode of the corresponding output channel(s) must be set to “sound A”.

## 4.4.13. Beeper

Beeper Volume	0014 <sub>hex</sub> H
OFF RESET	0000 0000 00 <sub>hex</sub>
Maximum Volume (full digital scale FDS)	0111 1111 7F <sub>hex</sub>
Beeper Frequency	0014 <sub>hex</sub> L
16 Hz (lowest)	0000 0001 01 <sub>hex</sub>
1 kHz	0100 0000 40 <sub>hex</sub>
4 kHz (highest)	1111 1111 FF <sub>hex</sub>

A squarewave beeper can be added to the loudspeaker channel. The addition point is just before volume adjustment.

**4.4.14. Automatic Volume Correction (AVC)**

AVC	on/off	0029 <sub>hex</sub>	[15..12]
AVC	off and Reset of int. variables	0000 RESET	0 <sub>hex</sub>
AVC	on	1000	8 <sub>hex</sub>
AVC	Decay Time	0029 <sub>hex</sub>	[11..8]
8 sec	(long)	1000	8 <sub>hex</sub>
4 sec	(middle)	0100	4 <sub>hex</sub>
2 sec	(short)	0010	2 <sub>hex</sub>
20 ms	(very short)	0001	1 <sub>hex</sub>

Different sound sources fairly often do not have the same volume level. Advertisement during movies, as well, usually has a different (higher) volume level than the movie itself. The Automatic Volume Correction (AVC) solves this problem and equalizes the volume levels.

The absolute value of the incoming signal is fed into a filter with 16 ms attack time and selectable decay time. The decay time must be adjusted as shown in the table above. This attack/decay filter block works similar to a peak hold function. The volume correction value with its quasi continuous step width is calculated using the attack/decay filter output.

The Automatic Volume Correction works with an internal reference level of –18 dBFS. This means, input signals with a volume level of –18 dBFS will not be affected by the AVC. If the input signals vary in a range of –24 dB to 0 dB, the AVC compensates this.

Example: A static input signal of 1 kHz on Scart has an output level as shown in the table below.

Scart Input 0 dBr = 2 Vrms	Volume Correc- tion	Main Output 0 dBr = 1.4 Vrms
0 dBr	–18 dB	–18 dBr
–6 dBr	–12 dB	–18 dBr
–12 dBr	–6 dB	–18 dBr
–18 dBr	–0 dB	–18 dBr
–24 dBr	+ 6 dB	–18 dBr
–30 dBr	+ 6 dB	–24 dBr
Loudspeaker Volume = 73 <sub>hex</sub> = 0 dBFS Scart Prescale = 20 <sub>hex</sub> i.e. 2.0 Vrms = 0 dBFS		

To reset the internal variables, the AVC should be switched off and on during any channel or source change. For standard applications, the recommended decay time is 4 sec.

**Note:** AVC should not be used in any Dolby Prologic mode, except PANORAMA, where no other than the loudspeaker output is active.

**4.5. DSP Read Registers: Functions and Values**

All readable registers are 16-bit wide. Transmissions via I<sup>2</sup>C bus have to take place in 16-bit words. Single data entries are 8 bit. Some of the defined 16-bit words are divided into low and high byte, thus holding two different control entities.

These registers are not writeable.

**4.5.1. Quasi-Peak Detector**

Quasi-Peak Readout Left	0019 <sub>hex</sub>	H+L
Quasi-Peak Readout Right	001A <sub>hex</sub>	H+L
Quasi peak readout	[0 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] values are 16 bit two's complement	

The quasi peak readout register can be used to read out the quasi peak level of any input source, in order to adjust all inputs to the same normal listening level. The refresh rate is 32 kHz. The feature is based on a filter time constant:

attack-time: 1.3 ms

decay-time: 37 ms

#### 4.5.2. BSP Hardware Version Code

Hardware Version	001E <sub>hex</sub> H
Hardware Version	[00 <sub>hex</sub> ... FF <sub>hex</sub> ]
BSP 3505D – A2	01 <sub>hex</sub>

A change in the hardware version code defines hardware optimizations that may have influence on the chip's behavior. The readout of this register is identical to the hardware version code in the chip's imprint.

#### 4.5.3. BSP Major Revision Code

Major Revision	001E <sub>hex</sub> L
BSP 3505D	04 <sub>hex</sub>

#### 4.5.4. BSP Product Code

Product	001F <sub>hex</sub> H
BSP 3505D	05 <sub>hex</sub>

#### 4.5.5. BSP ROM Version Code

ROM Version	001F <sub>hex</sub> L
Major software revision	[00 <sub>hex</sub> ... FF <sub>hex</sub> ]
BSP 3505D – A2	02 <sub>hex</sub>

A change in the ROM version code defines internal software optimizations, that may have influence on the chip's behavior, e.g. new features may have been included. While a software change is intended to create no compatibility problems, customers that want to use the new functions can identify new BSP 3505D versions according to this number.

## 5. Specifications

### 5.1. Outline Dimensions

SPGS7004-3/5E

## 5.5. Electrical Characteristics

### 5.5.1. Absolute Maximum Ratings

Symbol	Parameter	Pin Name	Min.	Max.	Unit
$T_A$	Ambient Operating Temperature	–	0	70 <sup>1)</sup>	°C
$T_S$	Storage Temperature	–	–40	125	°C
$V_{SUP1}$	First Supply Voltage	AHVSUP	–0.3	9.0	V
$V_{SUP2}$	Second Supply Voltage	DVSUP	–0.3	6.0	V
$V_{SUP3}$	Third Supply Voltage	AVSUP	–0.3	6.0	V
$dV_{SUP23}$	Voltage between AVSUP and DVSUP	AVSUP, DVSUP	–0.5	0.5	V
$P_{TOT}$	Chip Power Dissipation PLCC68 without Heat Spreader PSDIP64 without Heat Spreader PSDIP52 without Heat Spreader PQFP44 without Heat Spreader	AHVSUP, DVSUP, AVSUP		1200 1300 1200 960 <sup>1)</sup>	mW
$V_{Idig}$	Input Voltage, all Digital Inputs		–0.3	$V_{SUP2}+0.3$	V
$I_{Idig}$	Input Current, all Digital Pins	–	–20	+20	mA <sup>2)</sup>
$V_{Iana}$	Input Voltage, all Analog Inputs	SCn_IN_s, <sup>3)</sup> MONO_IN	–0.3	$V_{SUP1}+0.3$	V
$I_{Iana}$	Input Current, all Analog Inputs	SCn_IN_s, <sup>3)</sup> MONO_IN	–5	+5	mA <sup>2)</sup>
$I_{Oana}$	Output Current, all SCART Outputs	SC1_OUT_s	4), 5)	4), 5)	
$I_{Oana}$	Output Current, all Analog Outputs except SCART Outputs	DACM_s <sup>3)</sup>	4)	4)	
$I_{Cana}$	Output Current, other pins connected to capacitors	CAPL_M AGNDC	4)	4)	

1) For PQFP44 package, max. ambient operating temperature is 65 °C.

2) positive value means current flowing into the circuit

3) “n” means “1” or “2”, “s” means “L” or “R”

4) The Analog Outputs are short circuit proof with respect to First Supply Voltage and Ground.

5) Total chip power dissipation must not exceed absolute maximum rating.

Stresses beyond those listed in the “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions/Characteristics” of this specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.

**5.5.2. Recommended Operating Conditions**at  $T_A = 0$  to  $70\text{ }^{\circ}\text{C}$  ( $65\text{ }^{\circ}\text{C}$  for PQFP44)

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit

	Ceramic Capacitor in Parallel		−20%	100		nF
<div>1) External capacitors at each crystal pin to ground are required. The higher the capacitors, the lower the clock frequency results. The nominal free running frequency should match 18.432 MHz as closely as possible. Due to different layouts of customer PCBs, the matching capacitor size should be defined in the application. The suggested values (1.5 pF/3.3 pF) are figures based on experience with various PCB layouts.</div> <div>2) “n” means “1” or “2”, “s” means “L” or “R”</div>						

## 5.5.3. Characteristics

at  $T_A = 0$  to  $70\text{ }^{\circ}\text{C}$  ( $65\text{ }^{\circ}\text{C}$  for PQFP44),  $f_{\text{CLOCK}} = 18.432\text{ MHz}$ ,

$V_{\text{SUP1}} = 7.6$  to  $8.4\text{ V}$ ,  $V_{\text{SUP2}} = 4.75$  to  $5.25\text{ V}$  for min./max. values

at  $T_A = 60\text{ }^{\circ}\text{C}$ ,  $f_{\text{CLOCK}} = 18.432\text{ MHz}$ ,  $V_{\text{SUP1}} = 8\text{ V}$ ,  $V_{\text{SUP2}} = 5\text{ V}$  for typical values,  $T_J$  = Junction Temperature

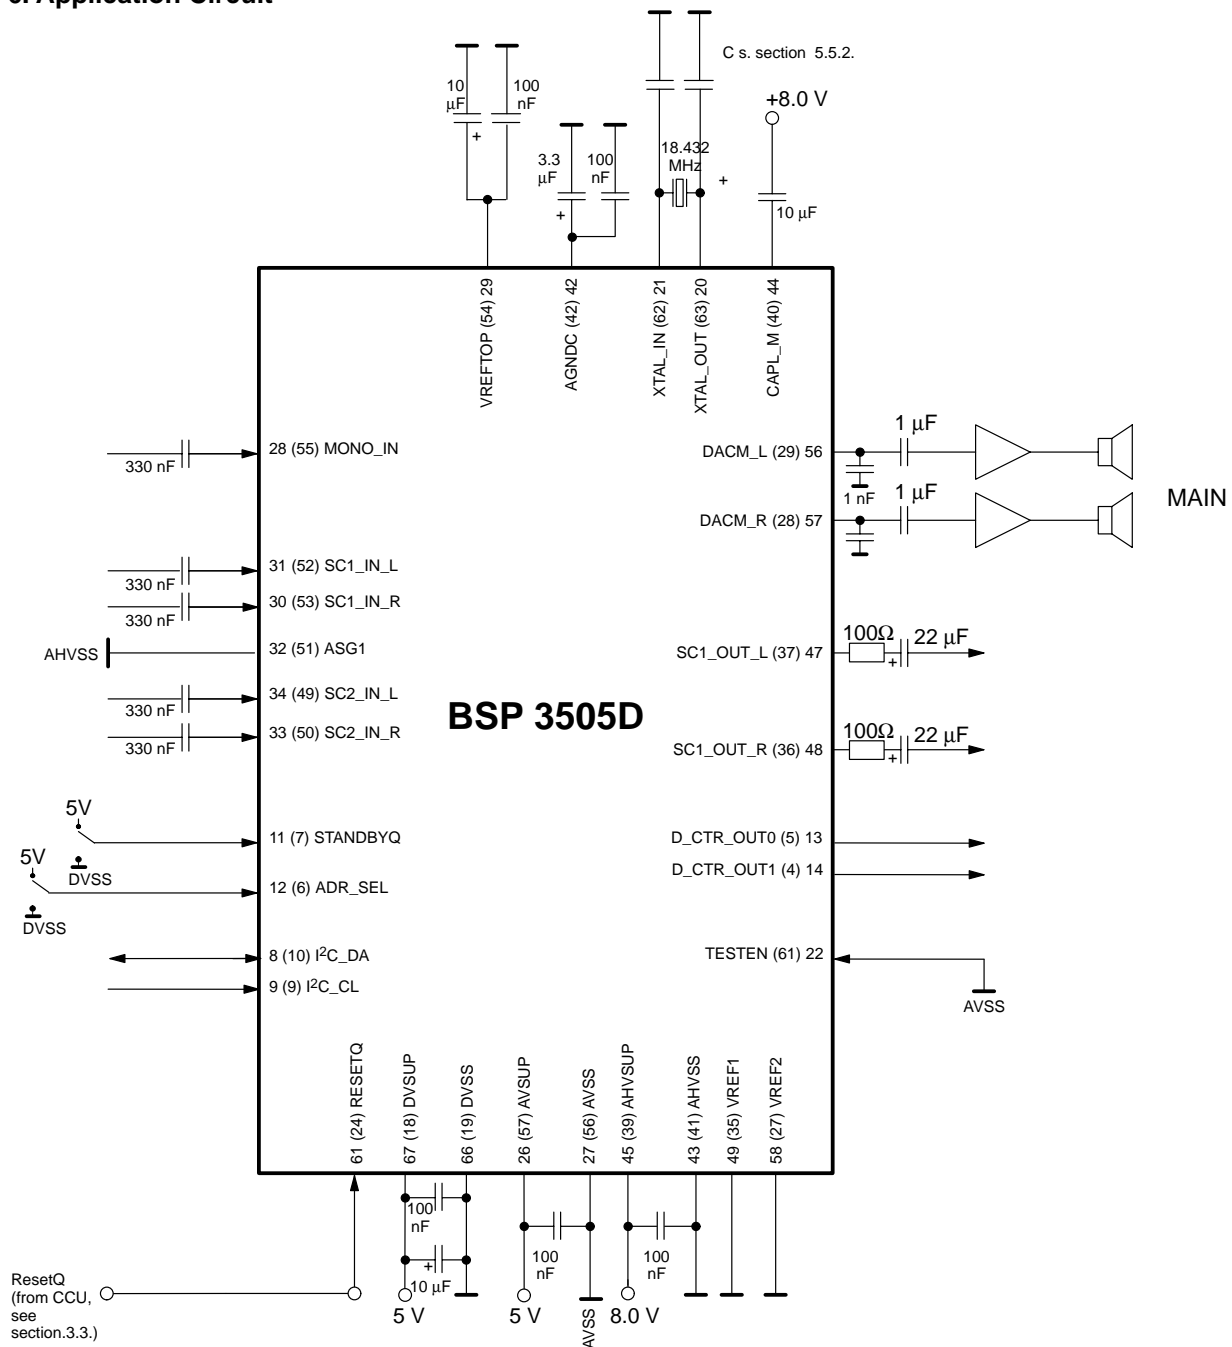

MAIN (M) = Loudspeaker Channel, AUX (A) = Headphone Channel

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions

	from Analog Input to SCART Output	MONO_IN, SCn_IN_s <sup>1)</sup> → SC1_OUT_s <sup>1)</sup>		0.01	0.03	%	Input Level = −3 dBr, f <sub>sig</sub> = 1 kHz, equally weighted 20 Hz ... 20 kHz
1) “n” means “1” or “2”; “s” means “L” or “R”							

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit	Test Conditions
XTALK	Crosstalk attenuation – PLCC68 – PSDIP64						Input Level = –3 dB, $f_{sig} = 1$ kHz, unused ana- log inputs connected to ground by $Z < 1$ k $\Omega$
	between left and right channel within SCART Input/Output pair (L→R, R→L)  SCn_IN <sup>1)</sup> → SC1_OUT	PLCC68 PSDIP64	80 80			dB dB	equally weighted 20 Hz...20 kHz
PSRR: rejection of noise on AHVSUP at 1 kHz							
	AGNDC	AGNDC		80		dB	
	From Analog Input to SCART Output	MONO_IN, SCn_IN_s <sup>1)</sup> SC1_OUT_s <sup>1)</sup>		70		dB	
DC <sub>VREFTOP</sub>	DC voltage at VREFTOP	VREFTOP	2.4	2.6	2.7	V	
1) “n” means “1” or “2”; “s” means “L” or “R”							

## 6. Application Circuit

**Note:** Pin numbers refer to the PLCC68 package, numbers in brackets refer to the PSDIP64 package.

### Application Note:

All ground pins should be connected to one low-resistive ground plane.

All supply pins should be connected separately with short and low-resistive lines to the power supply.

Decoupling capacitors from DVSUP to DVSS, AVSUP to AVSS, and AHVSUP to AHVSS are recommended as close as possible to these pins. Decoupling of DVSUP and DVSS is most important. We recommend using

more than one capacitor. By choosing different values, the frequency range of active decoupling can be extended. In our application boards we use: 220 pF, 470 pF, 1.5 nF, and 10 μF. The capacitor with lowest value should be placed nearest to the DVSUP and DVSS pins.

The ASG1 pin should be connected as closely as possible to the MSP to ground. If it is lead with the SC1 input-lines as shielding line, it should NOT be connected to ground at the SCART connector.

---
