

Smart Two Channel Highside Power Switch

Product Summary

Features

- Overload protection
- Current limitation
- Short-circuit protection
- Thermal shutdown
- Overtoltage protection (including load dump)
- Fast demagnetization of inductive loads
- Reverse battery protection¹⁾
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Open drain diagnostic output
- Open load detection in ON-state
- CMOS compatible input
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge (ESD) protection

Overtoltage Protection	V _{bb(AZ)}	43	V
Operating voltage	V _{bb(on)}	5.0 ... 34	V
active channels:	one	two parallel	
On-state resistance	R _{ON}	60	mΩ
Nominal load current	I _{L(NOM)}	4.0	A
Current limitation	I _{L(SCR)}	16	A

Application

- μC compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays and discrete circuits

General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology. Fully protected by embedded protection functions.

Pin Definitions and Functions

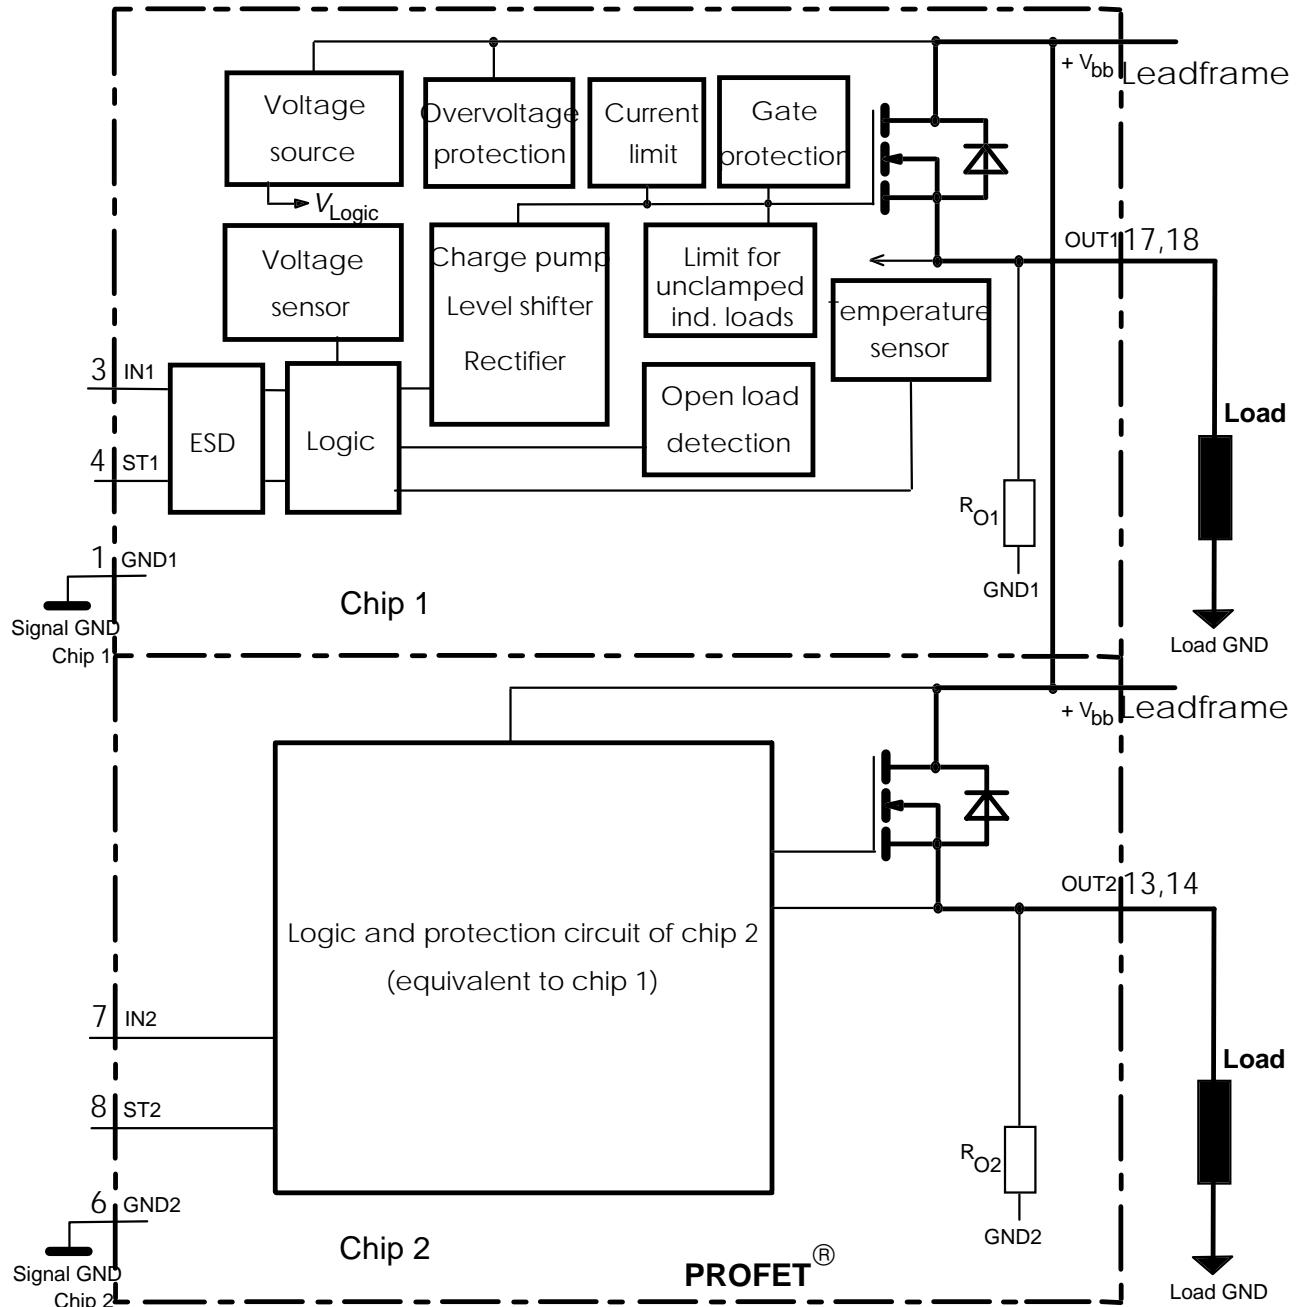

Pin	Symbol	Function
1,10, 11,12, 15,16, 19,20	V _{bb}	Positive power supply voltage. Design the wiring for the simultaneous max. short circuit currents from channel 1 to 2 and also for low thermal resistance
3	IN1	Input 1,2 , activates channel 1,2 in case of logic high signal
7	IN2	
17,18	OUT1	Output 1,2 , protected high-side power output of channel 1,2. Design the wiring for the max. short circuit current
13,14	OUT2	
4	ST1	Diagnostic feedback 1,2 of channel 1,2, open drain, low on failure
8	ST2	
2	GND1	Ground 1 of chip 1 (channel 1)
6	GND2	Ground 2 of chip 2 (channel 2)
5,9	N.C.	Not Connected

Reverse Battery

Reverse battery voltage ¹¹⁾	$-V_{bb}$	--	--	32	V
Drain-source diode voltage ($V_{out} > V_{bb}$) $I_L = -4.0\text{ A}$, $T_j = +150^\circ\text{C}$	$-V_{ON}$	--	610	--	mV

9) Add I_{ST} , if $I_{ST} > 0$

10) If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $V_{ON(CL)}$

11) Requires a $150\ \Omega$ resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 8).

Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 is easily possible by connecting the inputs and outputs in parallel. The status outputs ST1 and ST2 have to be configured as a 'Wired OR' function with a single pull-up resistor.

Terms

Leadframe (V_{bb}) is connected to pin 1,10,11,12,15,16,19,20

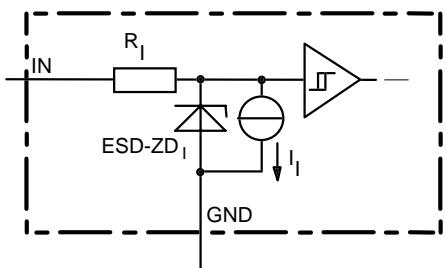

External R_{GND} optional; two resistors $R_{GND1}, R_{GND2} = 150 \Omega$ or a single resistor $R_{GND} = 75 \Omega$ for reverse battery protection up to the max. operating voltage.

14) With external resistor between output and V_{bb}

15) An external short of output to V_{bb} in the off state causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the $V_{ST\ low}$ signal may be errorious.

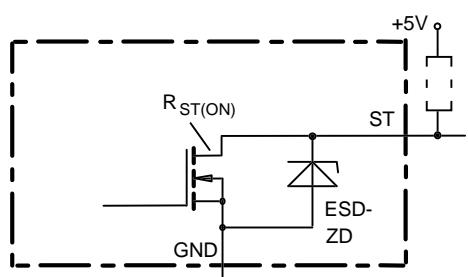

16) Low resistance to V_{bb} may be detected by no-load-detection

Input circuit (ESD protection), IN1 or IN2

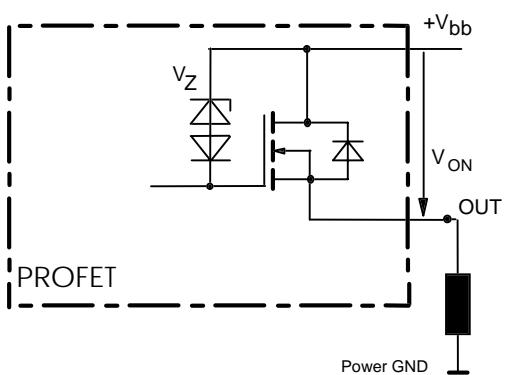

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Status output, ST1 or ST2

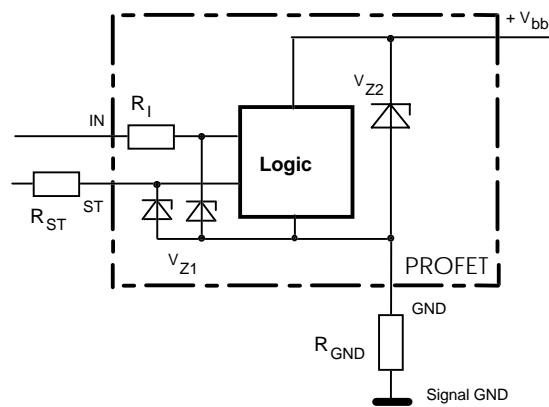

ESD-Zener diode: 6.1 V typ., max 5.0 mA; $R_{ST(ON)} < 380 \Omega$ at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Inductive and overvoltage output clamp, OUT1 or OUT2

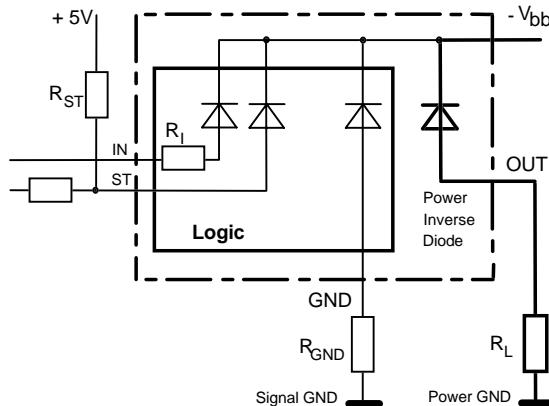

V_{ON} clamped to $V_{ON(CL)} = 47$ V typ.

Overvoltage protection of logic part GND1 or GND2

$V_{Z1} = 6.1$ V typ., $V_{Z2} = 47$ V typ., $R_I = 3.5 \text{ k}\Omega$ typ.,
 $R_{GND} = 150 \Omega$, $R_{ST} = 15 \text{ k}\Omega$ nominal.

Reverse battery protection

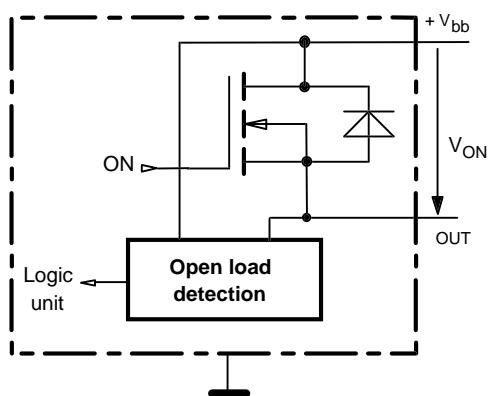

$R_{GND} = 150 \Omega$, $R_I = 3.5 \text{ k}\Omega$ typ,

Temperature protection is not active during inverse current operation.

Open-load detection, OUT1 or OUT2

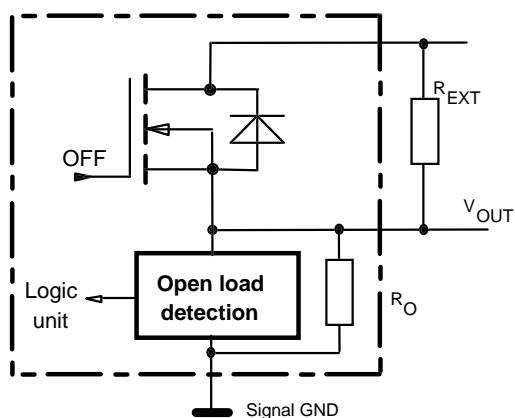

ON-state diagnostic condition:

$$V_{ON} < R_{ON} \cdot I_{L(OL)}; \text{ IN high}$$

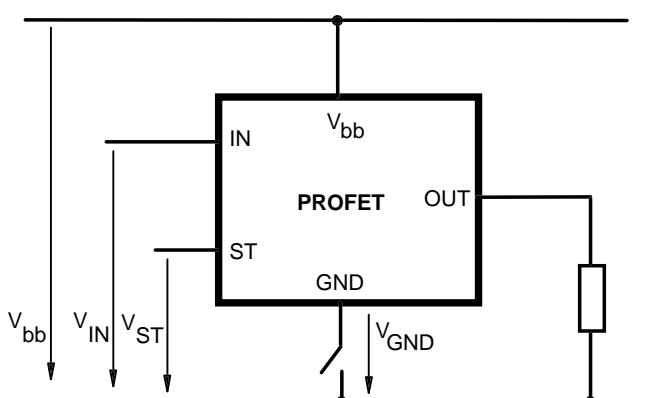

OFF-state diagnostic condition:

$$V_{OUT} > 3 \text{ V typ.; IN low}$$

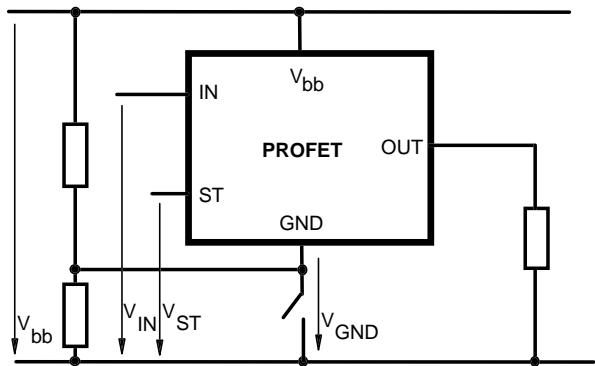

GND disconnect

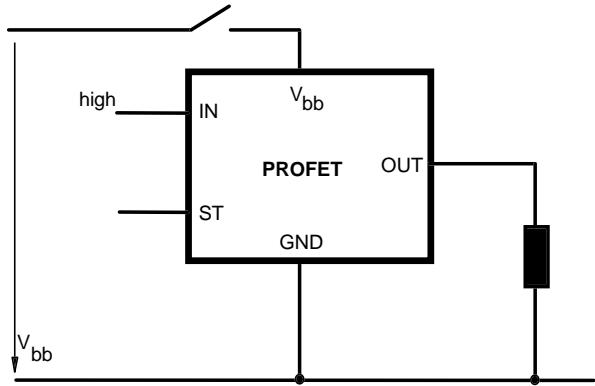

Any kind of load. In case of $IN=high$ is $V_{OUT} \approx V_{IN} - V_{IN(T)}$. Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off. Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

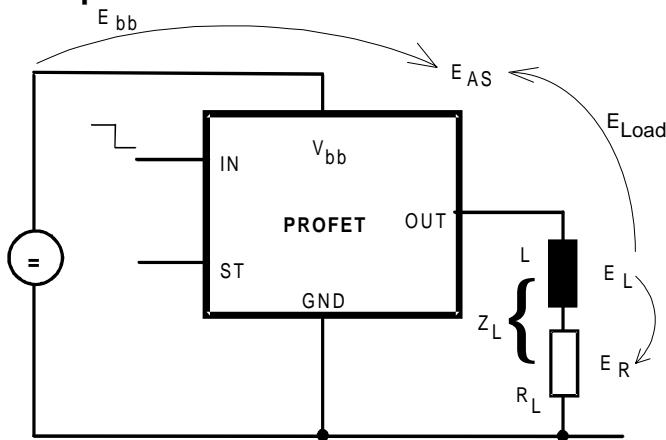

V_{bb} disconnect with energized inductive load

For an inductive load current up to the limit defined by E_{AS} (max. ratings see page 3 and diagram on page 10) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load the whole load current flows through the GND connection.

Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot i_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

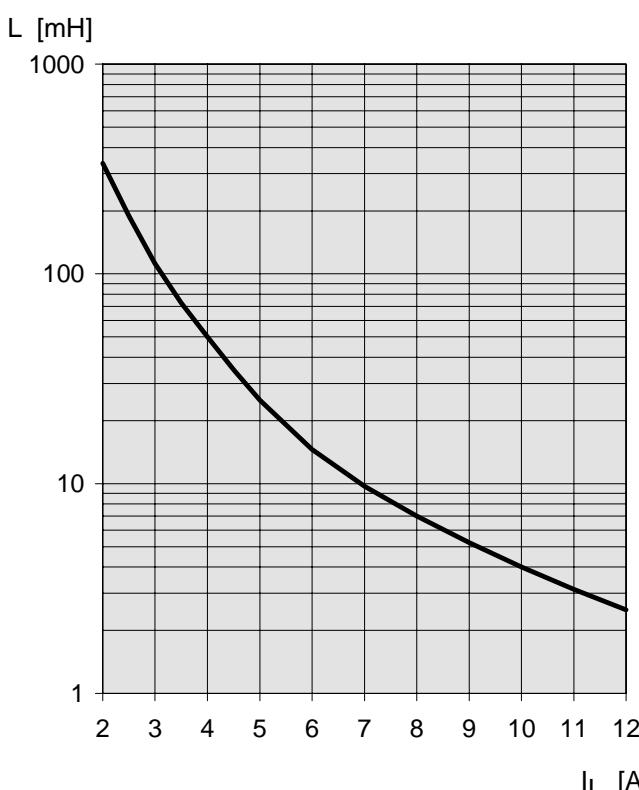

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{|I_L \cdot L|}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{|I_L \cdot R_L|}{|V_{OUT(CL)}|} \right)$$

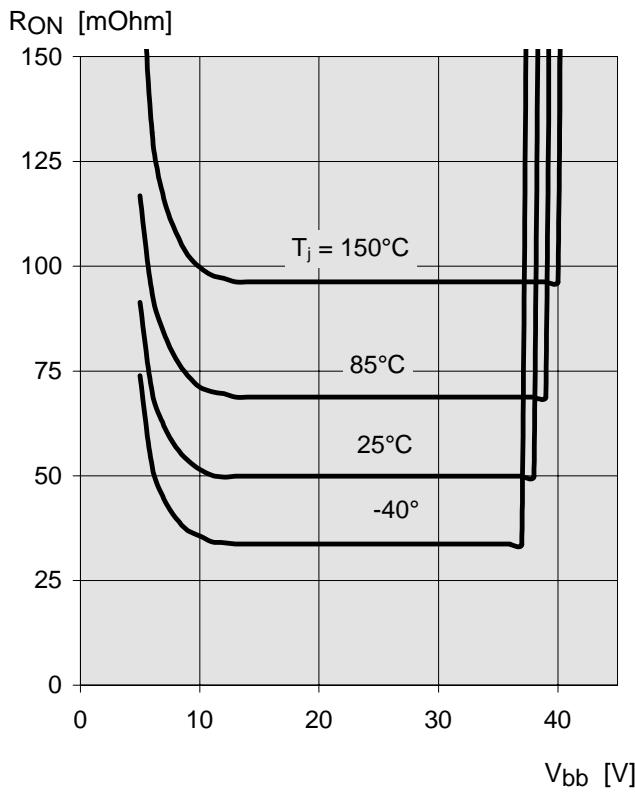

Maximum allowable load inductance for a single switch off (one channel)⁵⁾

$L = f(I_L)$; $T_{j,start} = 150^\circ\text{C}$, $V_{bb} = 12 \text{ V}$, $R_L = 0 \Omega$

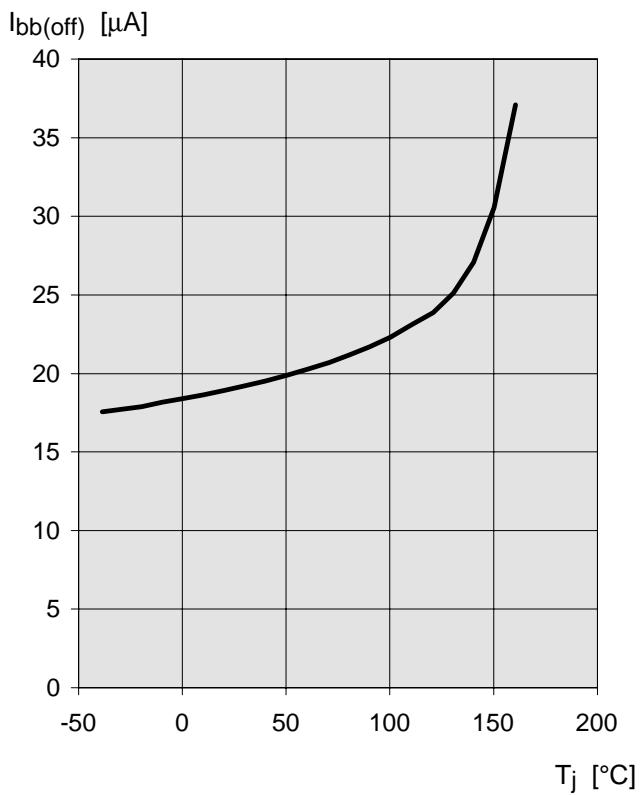

Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j)$; $I_L = 2 \text{ A}$, IN = high

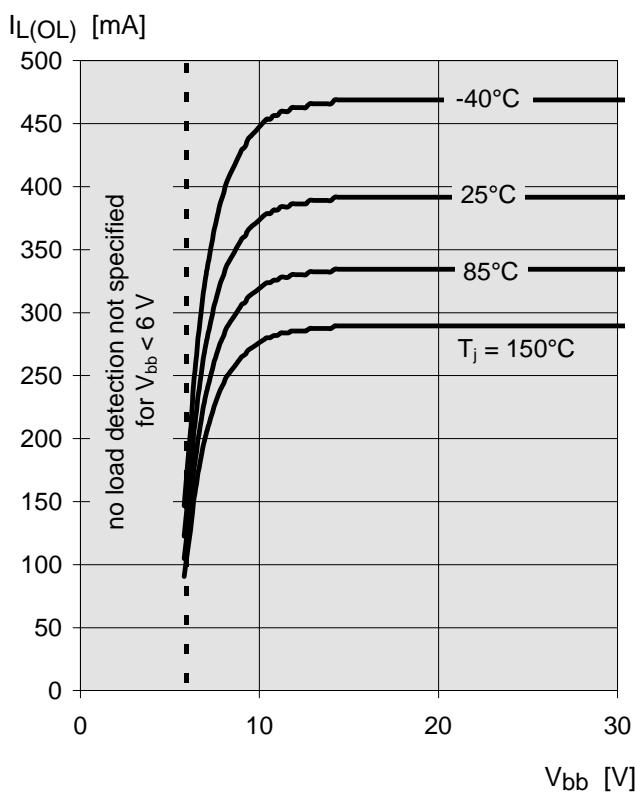

Typ. standby current

$I_{bb(off)} = f(T_j)$; $V_{bb} = 9 \dots 34 \text{ V}$, IN1,2 = low

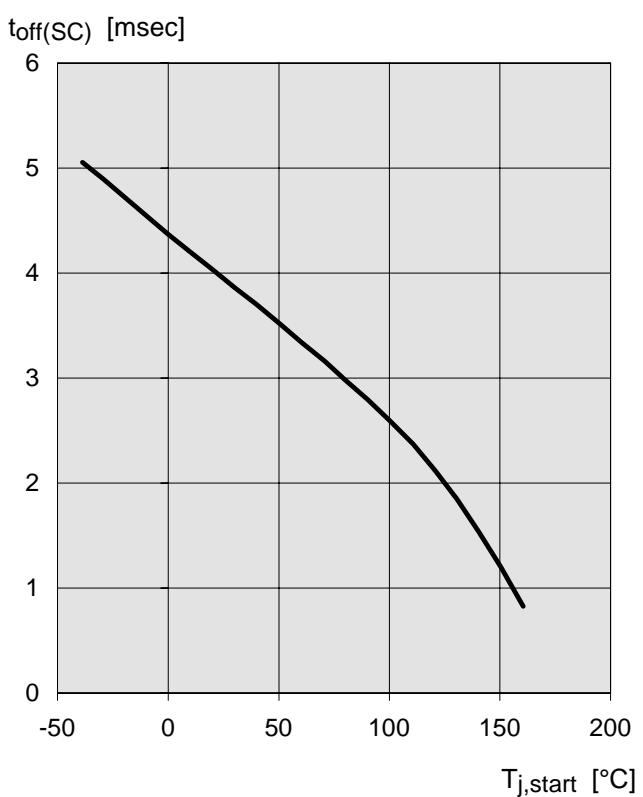

Typ. open load detection current

$I_{L(OL)} = f(V_{bb}, T_j)$; IN = high

Typ. initial short circuit shutdown time

$t_{off(SC)} = f(T_{j,start})$; $V_{bb} = 12 \text{ V}$
