Attention please!

The information herein is given to describe certain components and shall not be considered as warranted characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide (see address list).

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

Revision History: **2000-06**

V2.0

Previous Version: 1999-06
 1999-03 (Advance Information)

Page	Subjects (major changes since last revision)
---	Flash descriptions removed
2	Derivative table added
9	Open drain for all P4 pins
12	$\overline{\text{RSTIN}}$ note added
14	Block diagram updated
17	Note corrected
27, 28	GPT block diagrams updated
34	OWD description improved
38ff	Several markings corrected, RSTCON added
49	C_L adapted
50	Testcondition for hysteresis added
50	V_{OL} specification for $\overline{\text{RSTIN}}$ in bidirectional reset mode added
51	Inactive/active current specification for $\overline{\text{READY}}$ added
52	Separate table for power consumption
55	Description of clock configuration improved
59	Input clock specification improved
60	Reset calibration time specified, definition of V_{AREF} improved
63ff	Clock related timing introduced
74	XRAM access timing added

Controller Area Network (CAN): License of Robert Bosch GmbH

We Listen to Your Comments

Any information within this document that you feel is wrong, unclear or missing at all?
Your feedback will help us to continuously improve the quality of this document.

16-Bit Single-Chip Microcontroller C166 Family

C167CS

C167CS-4R, C167CS-L

- High Performance 16-bit CPU with 4-Stage Pipeline
 - 80/60 ns Instruction Cycle Time at 25/33 MHz CPU Clock
 - 400/303 ns Multiplication (16×16 bit), 800/606 ns Division (32/16 bit)
 - Enhanced Boolean Bit Manipulation Facilities
 - Additional Instructions to Support HLL and Operating Systems
 - Register-Based Design with Multiple Variable Register Banks
 - Single-Cycle Context Switching Support
 - 16 MBytes Total Linear Address Space for Code and Data
 - 1024 Bytes On-Chip Special Function Register Area
- 16-Priority-Level Interrupt System with 56 Sources, Sample-Rate down to 40/30 ns
- 8-Channel Interrupt-Driven Single-Cycle Data Transfer Facilities via Peripheral Event Controller (PEC)
- Clock Generation via on-chip PLL (factors 1:1.5/2/2.5/3/4/5), via prescaler or via direct clock input
- On-Chip Memory Modules
 - 3 KBytes On-Chip Internal RAM (IRAM)
 - 8 KBytes On-Chip Extension RAM (XRAM)
 - 32 KBytes On-Chip Program Mask ROM
- On-Chip Peripheral Modules
 - 24-Channel 10-bit A/D Converter with Programmable Conversion Time down to 7.8 μ s
 - Two 16-Channel Capture/Compare Units
 - 4-Channel PWM Unit
 - Two Multi-Functional General Purpose Timer Units with 5 Timers
 - Two Serial Channels (Synchronous/Asynchronous and High-Speed-Synchronous)
 - Two On-Chip CAN Interfaces (Rev. 2.0B active) with 2×15 Message Objects (Full CAN/Basic CAN), can work on one bus with 30 objects
 - On-Chip Real Time Clock
- Up to 16 MBytes External Address Space for Code and Data
 - Programmable External Bus Characteristics for Different Address Ranges
 - Multiplexed or Demultiplexed External Address/Data Buses with 8-Bit or 16-Bit Data Bus Width
 - Five Programmable Chip-Select Signals
 - Hold- and Hold-Acknowledge Bus Arbitration Support
- Idle, Sleep, and Power Down Modes with Flexible Power Management
- Programmable Watchdog Timer and Oscillator Watchdog
- Up to 111 General Purpose I/O Lines, partly with Selectable Input Thresholds and Hysteresis

- Supported by a Large Range of Development Tools like C-Compilers, Macro-Assembler Packages, Emulators, Evaluation Boards, HLL-Debuggers, Simulators, Logic Analyzer Disassemblers, Programming Boards
- On-Chip Bootstrap Loader
- 144-Pin MQFP Package

This document describes several derivatives of the C167 group. **Table 1** enumerates these derivatives and summarizes the differences. As this document refers to all of these derivatives, some descriptions may not apply to a specific product.

Table 1 C167CS Derivative Synopsis

Derivative	Program Memory	XRAM	CAN Interface
SAK-C167CS-LM SAB-C167CS-LM SAK-C167CS-L33M SAB-C167CS-L33M	---	8 KByte	CAN1, CAN2
SAK-C167CS-4RM SAB-C167CS-4RM SAK-C167CS-4R33M SAB-C167CS-4R33M	32 KByte ROM	8 KByte	CAN1, CAN2

For simplicity all versions are referred to by the term **C167CS** throughout this document.

Ordering Information

The ordering code for Infineon microcontrollers provides an exact reference to the required product. This ordering code identifies:

- the derivative itself, i.e. its function set, the temperature range, and the supply voltage
- the package and the type of delivery.

For the available ordering codes for the C167CS please refer to the “**Product Catalog Microcontrollers**”, which summarizes all available microcontroller variants.

Note: The ordering codes for Mask-ROM versions are defined for each product after verification of the respective ROM code.

Introduction

The C167CS derivatives are high performance derivatives of the Infineon C166 Family of full featured single-chip CMOS microcontrollers. They combine high CPU performance (up to 16.5 million instructions per second) with high peripheral functionality and enhanced IO-capabilities. They also provide clock generation via PLL and various on-chip memory modules like program ROM, internal RAM, and extension RAM.

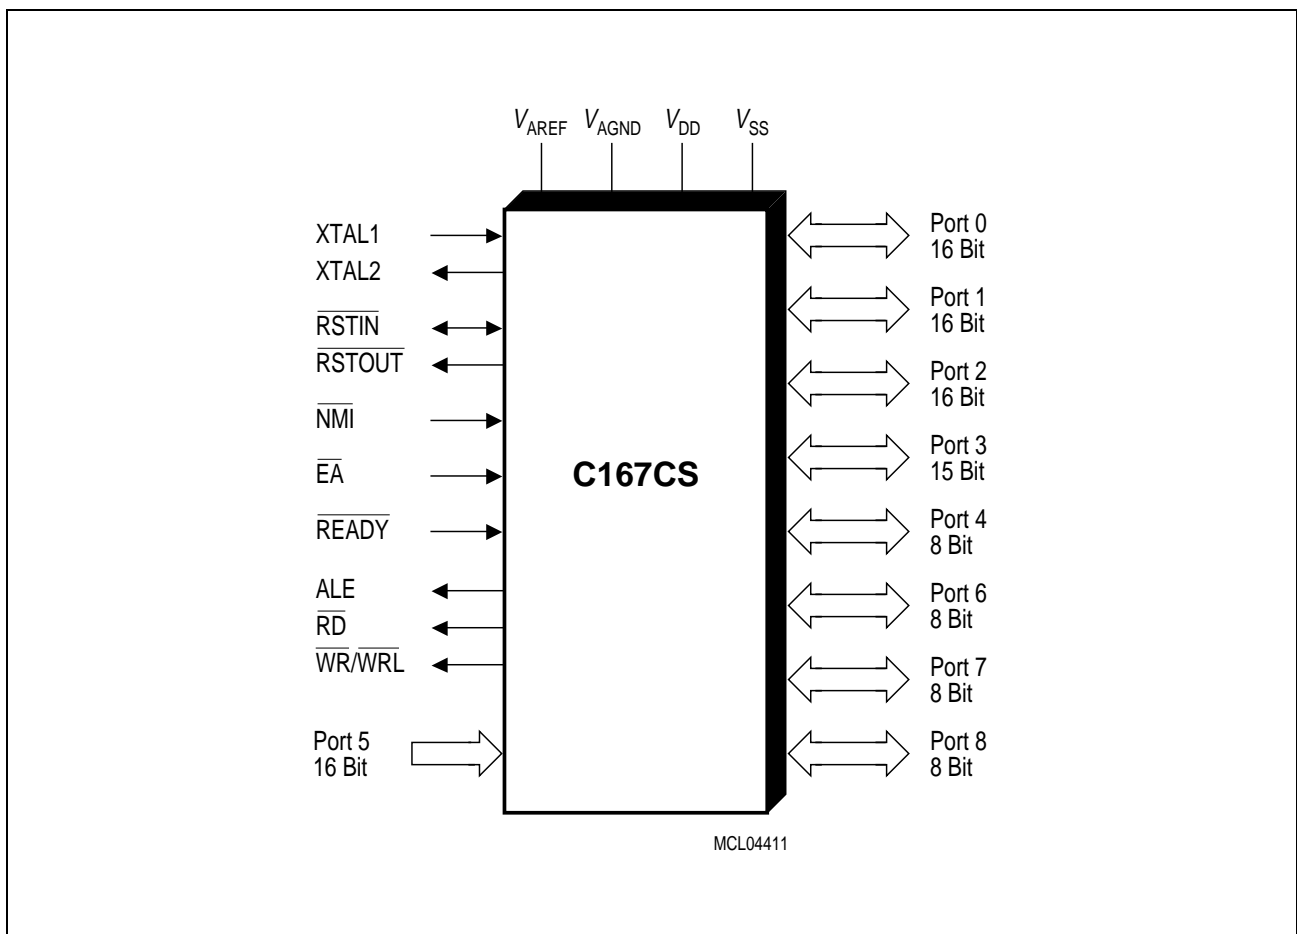

Figure 1 **Logic Symbol**

Pin Configuration
(top view)

Figure 2

*) The marked pins of Port 4 and Port 8 can have CAN interface lines assigned to them. [Table 2](#) on the pages below lists the possible assignments.

Table 2 Pin Definitions and Functions

Symbol	Pin Num.	Input Outp.	Function
P6		IO	Port 6 is an 8-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 6 outputs can be configured as push/pull or open drain drivers. The Port 6 pins also serve for alternate functions:
P6.0	1	O	<u>CS0</u> Chip Select 0 Output
P6.1	2	O	<u>CS1</u> Chip Select 1 Output
P6.2	3	O	<u>CS2</u> Chip Select 2 Output
P6.3	4	O	<u>CS3</u> Chip Select 3 Output
P6.4	5	O	<u>CS4</u> Chip Select 4 Output
P6.5	6	I	<u>HOLD</u> External Master Hold Request Input
P6.6	7	I/O	<u>HLDA</u> Hold Acknowledge Output (master mode) or Input (slave mode)
P6.7	8	O	<u>BREQ</u> Bus Request Output
P8		IO	Port 8 is an 8-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 8 outputs can be configured as push/pull or open drain drivers. The input threshold of Port 8 is selectable (TTL or special). Port 8 pins provide inputs/outputs for CAPCOM2 and serial interface lines. ¹⁾
P8.0	9	I/O	<u>CC16IO</u> CAPCOM2: CC16 Capture Inp./Compare Outp., I CAN1_RxD CAN 1 Receive Data Input, I CAN2_RxD CAN 2 Receive Data Input
P8.1	10	I/O	<u>CC17IO</u> CAPCOM2: CC17 Capture Inp./Compare Outp., O CAN1_TxD CAN 1 Transmit Data Output, O CAN2_TxD CAN 2 Transmit Data Output
P8.2	11	I/O	<u>CC18IO</u> CAPCOM2: CC18 Capture Inp./Compare Outp., I CAN1_RxD CAN 1 Receive Data Input, I CAN2_RxD CAN 2 Receive Data Input
P8.3	12	I/O	<u>CC19IO</u> CAPCOM2: CC19 Capture Inp./Compare Outp., I CAN1_TxD CAN 1 Transmit Data Output, I CAN2_TxD CAN 2 Transmit Data Output
P8.4	13	I/O	<u>CC20IO</u> CAPCOM2: CC20 Capture Inp./Compare Outp.
P8.5	14	I/O	<u>CC21IO</u> CAPCOM2: CC21 Capture Inp./Compare Outp.
P8.6	15	I/O	<u>CC22IO</u> CAPCOM2: CC22 Capture Inp./Compare Outp.
P8.7	16	I/O	<u>CC23IO</u> CAPCOM2: CC23 Capture Inp./Compare Outp.

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
P7		IO	Port 7 is an 8-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 7 outputs can be configured as push/pull or open drain drivers. The input threshold of Port 7 is selectable (TTL or special). The following Port 7 pins also serve for alternate functions:
P7.0	19	O	POUT0 PWM Channel 0 Output
P7.1	20	O	POUT1 PWM Channel 1 Output
P7.2	21	O	POUT2 PWM Channel 2 Output
P7.3	22	O	POUT3 PWM Channel 3 Output
P7.4	23	I/O	CC28IO CAPCOM2: CC28 Capture Inp./Compare Outp.
P7.5	24	I/O	CC29IO CAPCOM2: CC29 Capture Inp./Compare Outp.
P7.6	25	I/O	CC30IO CAPCOM2: CC30 Capture Inp./Compare Outp.
P7.7	26	I/O	CC31IO CAPCOM2: CC31 Capture Inp./Compare Outp.
P5		I	Port 5 is a 16-bit input-only port with Schmitt-Trigger char. The pins of Port 5 also serve as analog input channels for the A/D converter, or they serve as timer inputs:
P5.0	27	I	AN0
P5.1	28	I	AN1
P5.2	29	I	AN2
P5.3	30	I	AN3
P5.4	31	I	AN4
P5.5	32	I	AN5
P5.6	33	I	AN6
P5.7	34	I	AN7
P5.8	35	I	AN8
P5.9	36	I	AN9
P5.10	39	I	AN10, T6EUD GPT2 Timer T6 Ext. Up/Down Ctrl. Inp.
P5.11	40	I	AN11, T5EUD GPT2 Timer T5 Ext. Up/Down Ctrl. Inp.
P5.12	41	I	AN12, T6IN GPT2 Timer T6 Count Inp.
P5.13	42	I	AN13, T5IN GPT2 Timer T5 Count Inp.
P5.14	43	I	AN14, T4EUD GPT1 Timer T4 Ext. Up/Down Ctrl. Inp.
P5.15	44	I	AN15, T2EUD GPT1 Timer T5 Ext. Up/Down Ctrl. Inp.

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
P2		IO	Port 2 is a 16-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 2 outputs can be configured as push/pull or open drain drivers. The input threshold of Port 2 is selectable (TTL or special). The following Port 2 pins also serve for alternate functions:
P2.0	47	I/O	CC0IO CAPCOM1: CC0 Capture Inp./Compare Output
P2.1	48	I/O	CC1IO CAPCOM1: CC1 Capture Inp./Compare Output
P2.2	49	I/O	CC2IO CAPCOM1: CC2 Capture Inp./Compare Output
P2.3	50	I/O	CC3IO CAPCOM1: CC3 Capture Inp./Compare Output
P2.4	51	I/O	CC4IO CAPCOM1: CC4 Capture Inp./Compare Output
P2.5	52	I/O	CC5IO CAPCOM1: CC5 Capture Inp./Compare Output
P2.6	53	I/O	CC6IO CAPCOM1: CC6 Capture Inp./Compare Output
P2.7	54	I/O	CC7IO CAPCOM1: CC7 Capture Inp./Compare Output
P2.8	57	I/O	CC8IO CAPCOM1: CC8 Capture Inp./Compare Output, I EX0IN Fast External Interrupt 0 Input
P2.9	58	I/O	CC9IO CAPCOM1: CC9 Capture Inp./Compare Output, I EX1IN Fast External Interrupt 1 Input
P2.10	59	I/O	CC10IO CAPCOM1: CC10 Capture Inp./Compare Outp., I EX2IN Fast External Interrupt 2 Input
P2.11	60	I/O	CC11IO CAPCOM1: CC11 Capture Inp./Compare Outp., I EX3IN Fast External Interrupt 3 Input
P2.12	61	I/O	CC12IO CAPCOM1: CC12 Capture Inp./Compare Outp., I EX4IN Fast External Interrupt 4 Input
P2.13	62	I/O	CC13IO CAPCOM1: CC13 Capture Inp./Compare Outp., I EX5IN Fast External Interrupt 5 Input
P2.14	63	I/O	CC14IO CAPCOM1: CC14 Capture Inp./Compare Outp., I EX6IN Fast External Interrupt 6 Input
P2.15	64	I/O	CC15IO CAPCOM1: CC15 Capture Inp./Compare Outp., I EX7IN Fast External Interrupt 7 Input, I T7IN CAPCOM2: Timer T7 Count Input
			<i>Note: During Sleep Mode a spike filter on the EXnIN interrupt inputs suppresses input pulses <10 ns. Input pulses >100 ns safely pass the filter.</i>

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
P3		IO	Port 3 is a 15-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 3 outputs can be configured as push/pull or open drain drivers. The input threshold of Port 3 is selectable (TTL or special). The following Port 3 pins also serve for alternate functions:
P3.0	65	I	T0IN CAPCOM1 Timer T0 Count Input
P3.1	66	O	T6OUT GPT2 Timer T6 Toggle Latch Output
P3.2	67	I	CAPIN GPT2 Register CAPREL Capture Input
P3.3	68	O	T3OUT GPT1 Timer T3 Toggle Latch Output
P3.4	69	I	T3EUD GPT1 Timer T3 External Up/Down Control Input
P3.5	70	I	T4IN GPT1 Timer T4 Count/Gate/Reload/Capture Inp
P3.6	73	I	T3IN GPT1 Timer T3 Count/Gate Input
P3.7	74	I	T2IN GPT1 Timer T2 Count/Gate/Reload/Capture Inp
P3.8	75	I/O	MRST SSC Master-Receive/Slave-Transmit Inp./Outp.
P3.9	76	I/O	MTSR SSC Master-Transmit/Slave-Receive Outp./Inp.
P3.10	77	O	TxD0 ASC0 Clock/Data Output (Async./Sync.)
P3.11	78	I/O	RxD0 ASC0 Data Input (Async.) or Inp./Outp. (Sync.)
P3.12	79	O	<u>BHE</u> External Memory High Byte Enable Signal,
		O	<u>WRH</u> External Memory High Byte Write Strobe
P3.13	80	I/O	SCLK SSC Master Clock Output / Slave Clock Input.
P3.15	81	O	CLKOUT System Clock Output (= CPU Clock)
		O	FOUT Programmable Frequency Output
NC	84	–	This pin is not connected in the C167CS. No connection to the PCB is required.

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
P4		IO	Port 4 is an 8-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. The Port 4 outputs can be configured as push/pull or open drain drivers. The input threshold of Port 4 is selectable (TTL or special). Port 4 can be used to output the segment address lines and for serial interface lines: ¹⁾
P4.0	85	O	A16 Least Significant Segment Address Line
P4.1	86	O	A17 Segment Address Line
P4.2	87	O	A18 Segment Address Line
P4.3	88	O	A19 Segment Address Line
P4.4	89	O	A20 Segment Address Line,
		I	CAN2_RxD CAN 2 Receive Data Input
P4.5	90	O	A21 Segment Address Line,
		I	CAN1_RxD CAN 1 Receive Data Input
P4.6	91	O	A22 Segment Address Line,
		O	CAN1_TxD CAN 1 Transmit Data Output,
		O	CAN2_TxD CAN 2 Transmit Data Output
P4.7	92	O	A23 Most Significant Segment Address Line,
		I	CAN1_RxD CAN 1 Receive Data Input,
		O	CAN2_TxD CAN 2 Transmit Data Output,
		I	CAN2_RxD CAN 2 Receive Data Input
$\overline{\text{RD}}$	95	O	External Memory Read Strobe. $\overline{\text{RD}}$ is activated for every external instruction or data read access.
$\overline{\text{WR/}}$ $\overline{\text{WRL}}$	96	O	External Memory Write Strobe. In $\overline{\text{WR}}$ -mode this pin is activated for every external data write access. In $\overline{\text{WRL}}$ -mode this pin is activated for low byte data write accesses on a 16-bit bus, and for every data write access on an 8-bit bus. See WRCFG in register SYSCON for mode selection.
$\overline{\text{READY}}$	97	I	Ready Input. When the Ready function is enabled, a high level at this pin during an external memory access will force the insertion of memory cycle time waitstates until the pin returns to a low level. An internal pullup device will hold this pin high when nothing is driving it.

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function																		
ALE	98	O	Address Latch Enable Output. Can be used for latching the address into external memory or an address latch in the multiplexed bus modes.																		
$\overline{\text{EA}}$	99	I	External Access Enable pin. A low level at this pin during and after Reset forces the C167CS to begin instruction execution out of external memory. A high level forces execution out of the internal program memory. "ROMless" versions must have this pin tied to '0'.																		
PORT0 POL.0-7 POH.0-7	100-107 108, 111-117	IO	<p>PORT0 consists of the two 8-bit bidirectional I/O ports POL and POH. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state.</p> <p>In case of an external bus configuration, PORT0 serves as the address (A) and address/data (AD) bus in multiplexed bus modes and as the data (D) bus in demultiplexed bus modes.</p> <p>Demultiplexed bus modes:</p> <table> <tr> <td>Data Path Width:</td> <td>8-bit</td> <td>16-bit</td> </tr> <tr> <td>POL.0 – POL.7:</td> <td>D0 – D7</td> <td>D0 - D7</td> </tr> <tr> <td>POH.0 – POH.7:</td> <td>I/O</td> <td>D8 - D15</td> </tr> </table> <p>Multiplexed bus modes:</p> <table> <tr> <td>Data Path Width:</td> <td>8-bit</td> <td>16-bit</td> </tr> <tr> <td>POL.0 – POL.7:</td> <td>AD0 – AD7</td> <td>AD0 - AD7</td> </tr> <tr> <td>POH.0 – POH.7:</td> <td>A8 - A15</td> <td>AD8 - AD15</td> </tr> </table>	Data Path Width:	8-bit	16-bit	POL.0 – POL.7:	D0 – D7	D0 - D7	POH.0 – POH.7:	I/O	D8 - D15	Data Path Width:	8-bit	16-bit	POL.0 – POL.7:	AD0 – AD7	AD0 - AD7	POH.0 – POH.7:	A8 - A15	AD8 - AD15

POL.0 – POL.7:	AD0 – AD7	AD0 - AD7																			
POH.0 – POH.7:	A8 - A15	AD8 - AD15																			

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Output.	Function	
PORT1		IO	PORT1 consists of the two 8-bit bidirectional I/O ports P1L and P1H. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. PORT1 is used as the 16-bit address bus (A) in demultiplexed bus modes and also after switching from a demultiplexed bus mode to a multiplexed bus mode.	
P1L.0-7	118-125		<p>The following PORT1 pins also serve for alternate functions:</p> <p>AN16 Analog Input Channel 16</p> <p>AN17 Analog Input Channel 17</p> <p>AN18 Analog Input Channel 18</p> <p>AN19 Analog Input Channel 19</p> <p>AN20 Analog Input Channel 20</p> <p>AN21 Analog Input Channel 21</p> <p>AN22 Analog Input Channel 22</p> <p>AN23 Analog Input Channel 23</p> <p>CC24IO CAPCOM2: CC24 Capture Inp./Compare Outp.</p> <p>CC25IO CAPCOM2: CC25 Capture Inp./Compare Outp.</p> <p>CC26IO CAPCOM2: CC26 Capture Inp./Compare Outp.</p> <p>CC27IO CAPCOM2: CC27 Capture Inp./Compare Outp.</p>	
P1H.0-7	128-135			
P1L.0	118	I		
P1L.1	119	I		
P1L.2	120	I		
P1L.3	121	I		
P1L.4	122	I		
P1L.5	123	I		
P1L.6	124	I		
P1L.7	125	I		
P1H.4	132	I/O		
P1H.5	133	I/O		
P1H.6	134	I/O		
P1H.7	135	I/O		
XTAL2	137	O		XTAL2: Output of the oscillator amplifier circuit.
XTAL1	138	I		XTAL1: Input to the oscillator amplifier and input to the internal clock generator
			To clock the device from an external source, drive XTAL1, while leaving XTAL2 unconnected. Minimum and maximum high/low and rise/fall times specified in the AC Characteristics must be observed.	

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
$\overline{\text{RSTIN}}$	140	I/O	<p>Reset Input with Schmitt-Trigger characteristics. A low level at this pin while the oscillator is running resets the C167CS. An internal pullup resistor permits power-on reset using only a capacitor connected to V_{SS}.</p> <p>A spike filter suppresses input pulses < 10 ns. Input pulses > 100 ns safely pass the filter. The minimum duration for a safe recognition should be 100 ns + 2 CPU clock cycles.</p> <p>In bidirectional reset mode (enabled by setting bit BDRSTEN in register SYSCON) the $\overline{\text{RSTIN}}$ line is internally pulled low for the duration of the internal reset sequence upon any reset (HW, SW, WDT). See note below this table.</p> <p><i>Note: To let the reset configuration of PORT0 settle and to let the PLL lock a reset duration of ca. 1 ms is recommended.</i></p>
$\overline{\text{RSTOUT}}$	141	O	<p>Internal Reset Indication Output. This pin is set to a low level when the part is executing either a hardware-, a software- or a watchdog timer reset. $\overline{\text{RSTOUT}}$ remains low until the EINIT (end of initialization) instruction is executed.</p>
$\overline{\text{NMI}}$	142	I	<p>Non-Maskable Interrupt Input. A high to low transition at this pin causes the CPU to vector to the NMI trap routine. When the PWRDN (power down) instruction is executed, the $\overline{\text{NMI}}$ pin must be low in order to force the C167CS to go into power down mode. If $\overline{\text{NMI}}$ is high, when PWRDN is executed, the part will continue to run in normal mode.</p> <p>If not used, pin $\overline{\text{NMI}}$ should be pulled high externally.</p>
V_{AREF}	37	–	Reference voltage for the A/D converter.
V_{AGND}	38	–	Reference ground for the A/D converter.

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num.	Input Outp.	Function
V_{DD}	17, 46, 56, 72, 82, 93, 109, 126, 136, 144	–	Digital Supply Voltage: + 5 V during normal operation and idle mode. ≥ 2.5 V during power down mode.
V_{SS}	18, 45, 55, 71, 83, 94, 110, 127, 139, 143	–	Digital Ground.

1) The CAN interface lines are assigned to ports P4 and P8 under software control. Within the CAN module several assignments can be selected.

Note: The following behaviour differences must be observed when the bidirectional reset is active:

- Bit BDRSTEN in register SYSCON cannot be changed after EINIT and is cleared automatically after a reset.
- The reset indication flags always indicate a long hardware reset.
- The PORT0 configuration is treated like on a hardware reset. Especially the bootstrap loader may be activated when P0L.4 is low.
- Pin RSTIN may only be connected to external reset devices with an open drain output driver.
- A short hardware reset is extended to the duration of the internal reset sequence.

Functional Description

The architecture of the C167CS combines advantages of both RISC and CISC processors and of advanced peripheral subsystems in a very well-balanced way. In addition the on-chip memory blocks allow the design of compact systems with maximum performance.

The following block diagram gives an overview of the different on-chip components and of the advanced, high bandwidth internal bus structure of the C167CS.

*Note: All time specifications refer to a CPU clock of 33 MHz
(see definition in the AC Characteristics section).*

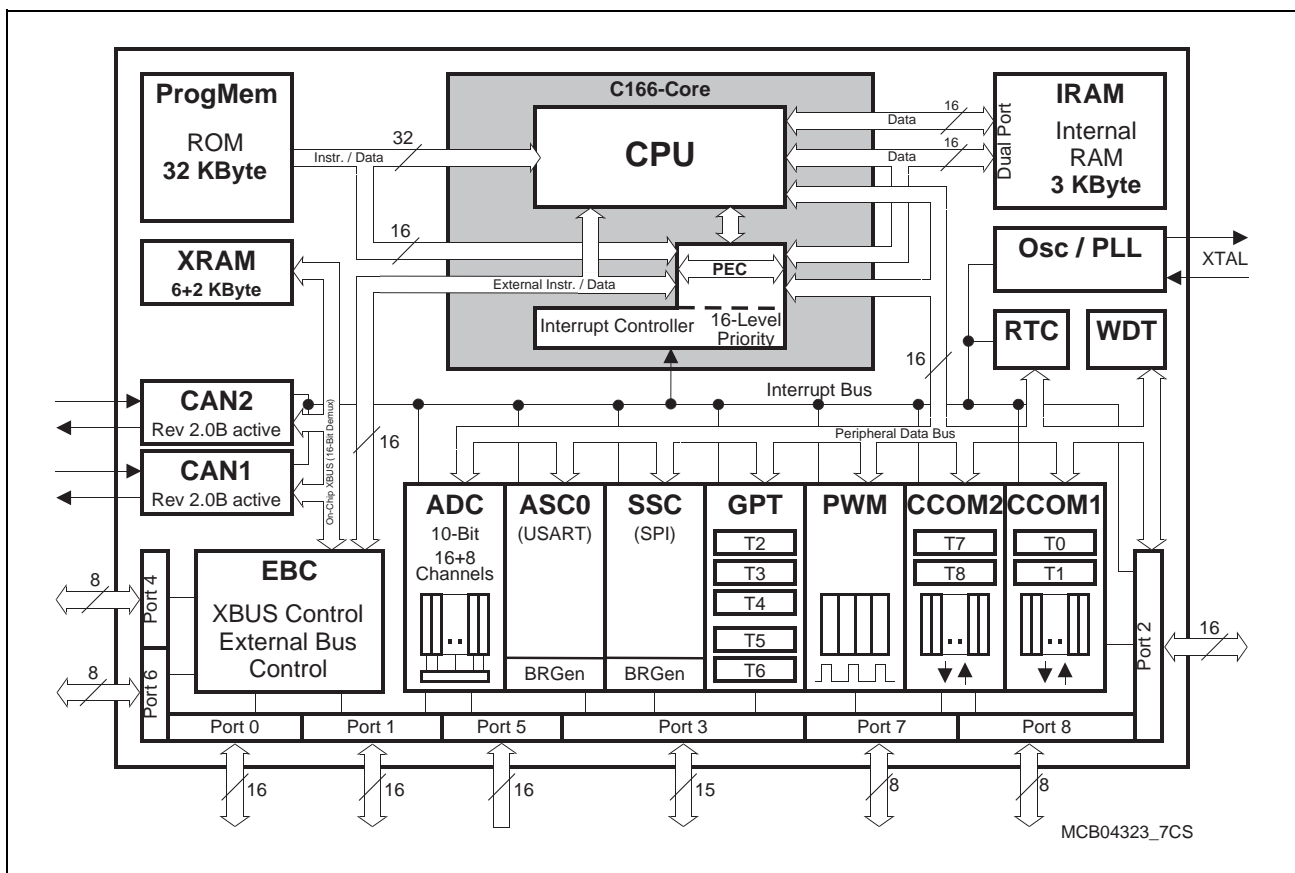

Figure 3 Block Diagram

The program memory, the internal RAM (IRAM) and the set of generic peripherals are connected to the CPU via separate buses. A fourth bus, the XBUS, connects external resources as well as additional on-chip resources, the X-Peripherals (see [Figure 3](#)).

The XBUS resources (XRAM, CAN) of the C167CS can be individually enabled or disabled during initialization. Register XPERCON selects the required modules which are then enabled by setting the general X-Peripheral enable bit XPEN (SYSCON.2). Modules that are disabled consume neither address space nor port pins.

Note: The default value of register XPERCON after reset selects 2 KByte XRAM and module CAN1, so the default XBUS resources are compatible with the C167CR.

Memory Organization

The memory space of the C167CS is configured in a Von Neumann architecture which means that code memory, data memory, registers and I/O ports are organized within the same linear address space which includes 16 MBytes. The entire memory space can be accessed bitwise or wordwise. Particular portions of the on-chip memory have additionally been made directly bitaddressable.

The C167CS incorporates 32 KBytes of on-chip mask-programmable ROM (not in the ROM-less derivative, of course) for code or constant data. The 32 KBytes of the on-chip ROM can be mapped either to segment 0 or segment 1.

3 KBytes of on-chip Internal RAM (IRAM) are provided as a storage for user defined variables, for the system stack, general purpose register banks and even for code. A register bank can consist of up to 16 wordwide (R0 to R15) and/or bitwise (RL0, RH0, ..., RL7, RH7) so-called General Purpose Registers (GPRs).

1024 bytes (2×512 bytes) of the address space are reserved for the Special Function Register areas (SFR space and ESFR space). SFRs are wordwide registers which are used for controlling and monitoring functions of the different on-chip units. Unused SFR addresses are reserved for future members of the C166 Family.

8 KBytes of on-chip Extension RAM (XRAM), organized as two blocks of 2 KByte and 6 KByte, respectively, are provided to store user data, user stacks, or code. The XRAM is accessed like external memory and therefore cannot be used for the system stack or for register banks and is not bitaddressable. The XRAM permits 16-bit accesses with maximum speed.

In order to meet the needs of designs where more memory is required than is provided on chip, up to 16 MBytes of external RAM and/or ROM can be connected to the microcontroller.

External Bus Controller

All of the external memory accesses are performed by a particular on-chip External Bus Controller (EBC). It can be programmed either to Single Chip Mode when no external memory is required, or to one of four different external memory access modes, which are as follows:

- 16-/18-/20-/24-bit Addresses, 16-bit Data, Demultiplexed
- 16-/18-/20-/24-bit Addresses, 16-bit Data, Multiplexed
- 16-/18-/20-/24-bit Addresses, 8-bit Data, Multiplexed
- 16-/18-/20-/24-bit Addresses, 8-bit Data, Demultiplexed

In the demultiplexed bus modes, addresses are output on PORT1 and data is input/output on PORT0 or P0L, respectively. In the multiplexed bus modes both addresses and data use PORT0 for input/output.

Important timing characteristics of the external bus interface (Memory Cycle Time, Memory Tri-State Time, Length of ALE and Read Write Delay) have been made programmable to allow the user the adaption of a wide range of different types of memories and external peripherals.

In addition, up to 4 independent address windows may be defined (via register pairs ADDRSELx / BUSCONx) which control the access to different resources with different bus characteristics. These address windows are arranged hierarchically where BUSCON4 overrides BUSCON3 and BUSCON2 overrides BUSCON1. All accesses to locations not covered by these 4 address windows are controlled by BUSCON0.

Up to 5 external \overline{CS} signals (4 windows plus default) can be generated in order to save external glue logic. The C167CS offers the possibility to switch the \overline{CS} outputs to an unlatched mode. In this mode the internal filter logic is switched off and the \overline{CS} signals are directly generated from the address. The unlatched \overline{CS} mode is enabled by setting CSCFG (SYSCON.6).

Access to very slow memories or memories with varying access times is supported via a particular 'Ready' function.

A $\overline{HOLD}/\overline{HLDA}$ protocol is available for bus arbitration and allows to share external resources with other bus masters. The bus arbitration is enabled by setting bit HLDEN in register PSW. After setting HLDEN once, pins P6.7 ... P6.5 (BREQ, HLDA, HOLD) are automatically controlled by the EBC. In Master Mode (default after reset) the HLDA pin is an output. By setting bit DP6.7 to '1' the Slave Mode is selected where pin HLDA is switched to input. This allows to directly connect the slave controller to another master controller without glue logic.

For applications which require less than 16 MBytes of external memory space, this address space can be restricted to 1 MByte, 256 KByte, or to 64 KByte. In this case Port 4 outputs four, two, or no address lines at all. It outputs all 8 address lines, if an address space of 16 MBytes is used.

Note: When one or both of the on-chip CAN Modules are used with the interface lines assigned to Port 4, the CAN lines override the segment address lines and the segment address output on Port 4 is therefore limited to 6/4 bits i.e. address lines A21/A19 ... A16. \overline{CS} lines can be used to increase the total amount of addressable external memory.

Central Processing Unit (CPU)

The main core of the CPU consists of a 4-stage instruction pipeline, a 16-bit arithmetic and logic unit (ALU) and dedicated SFRs. Additional hardware has been spent for a separate multiply and divide unit, a bit-mask generator and a barrel shifter.

Based on these hardware provisions, most of the C167CS's instructions can be executed in just one machine cycle which requires 60 ns at 33 MHz CPU clock. For example, shift and rotate instructions are always processed during one machine cycle independent of the number of bits to be shifted. All multiple-cycle instructions have been optimized so that they can be executed very fast as well: branches in 2 cycles, a 16×16 bit multiplication in 5 cycles and a 32-/16 bit division in 10 cycles. Another pipeline optimization, the so-called 'Jump Cache', allows reducing the execution time of repeatedly performed jumps in a loop from 2 cycles to 1 cycle.

Figure 4 CPU Block Diagram

The CPU has a register context consisting of up to 16 wordwide GPRs at its disposal. These 16 GPRs are physically allocated within the on-chip RAM area. A Context Pointer (CP) register determines the base address of the active register bank to be accessed by the CPU at any time. The number of register banks is only restricted by the available internal RAM space. For easy parameter passing, a register bank may overlap others.

A system stack of up to 1024 words is provided as a storage for temporary data. The system stack is allocated in the on-chip RAM area, and it is accessed by the CPU via the stack pointer (SP) register. Two separate SFRs, STKOV and STKUN, are implicitly compared against the stack pointer value upon each stack access for the detection of a stack overflow or underflow.

The high performance offered by the hardware implementation of the CPU can efficiently be utilized by a programmer via the highly efficient C167CS instruction set which includes the following instruction classes:

- Arithmetic Instructions
- Logical Instructions
- Boolean Bit Manipulation Instructions
- Compare and Loop Control Instructions
- Shift and Rotate Instructions
- Prioritize Instruction
- Data Movement Instructions
- System Stack Instructions
- Jump and Call Instructions
- Return Instructions
- System Control Instructions
- Miscellaneous Instructions

The basic instruction length is either 2 or 4 bytes. Possible operand types are bits, bytes and words. A variety of direct, indirect or immediate addressing modes are provided to specify the required operands.

Interrupt System

With an interrupt response time within a range from just 5 to 12 CPU clocks (in case of internal program execution), the C167CS is capable of reacting very fast to the occurrence of non-deterministic events.

The architecture of the C167CS supports several mechanisms for fast and flexible response to service requests that can be generated from various sources internal or external to the microcontroller. Any of these interrupt requests can be programmed to being serviced by the Interrupt Controller or by the Peripheral Event Controller (PEC).

In contrast to a standard interrupt service where the current program execution is suspended and a branch to the interrupt vector table is performed, just one cycle is 'stolen' from the current CPU activity to perform a PEC service. A PEC service implies a single byte or word data transfer between any two memory locations with an additional increment of either the PEC source or the destination pointer. An individual PEC transfer counter is implicitly decremented for each PEC service except when performing in the continuous transfer mode. When this counter reaches zero, a standard interrupt is performed to the corresponding source related vector location. PEC services are very well suited, for example, for supporting the transmission or reception of blocks of data. The C167CS has 8 PEC channels each of which offers such fast interrupt-driven data transfer capabilities.

A separate control register which contains an interrupt request flag, an interrupt enable flag and an interrupt priority bitfield exists for each of the possible interrupt sources. Via its related register, each source can be programmed to one of sixteen interrupt priority levels. Once having been accepted by the CPU, an interrupt service can only be interrupted by a higher prioritized service request. For the standard interrupt processing, each of the possible interrupt sources has a dedicated vector location.

Fast external interrupt inputs are provided to service external interrupts with high precision requirements. These fast interrupt inputs feature programmable edge detection (rising edge, falling edge or both edges).

Software interrupts are supported by means of the 'TRAP' instruction in combination with an individual trap (interrupt) number.

Table 3 shows all of the possible C167CS interrupt sources and the corresponding hardware-related interrupt flags, vectors, vector locations and trap (interrupt) numbers.

Note: Interrupt nodes which are not used by associated peripherals, may be used to generate software controlled interrupt requests by setting the respective interrupt request bit (xIR).

Table 3 C167CS Interrupt Nodes

Source of Interrupt or PEC Service Request	Request Flag	Enable Flag	Interrupt Vector	Vector Location	Trap Number
CAPCOM Register 0	CC0IR	CC0IE	CC0INT	00'0040 _H	10 _H

The C167CS also provides an excellent mechanism to identify and to process exceptions or error conditions that arise during run-time, so-called 'Hardware Traps'. Hardware traps cause immediate non-maskable system reaction which is similar to a standard interrupt service (branching to a dedicated vector table location). The occurrence of a hardware trap is additionally signified by an individual bit in the trap flag register (TFR). Except when another higher prioritized trap service is in progress, a hardware trap will interrupt any actual program execution. In turn, hardware trap services can normally not be interrupted by standard or PEC interrupts.

Table 4 shows all of the possible exceptions or error conditions that can arise during run-time:

Table 4 Hardware Trap Summary

Exception Condition	Trap Flag	Trap Vector	Vector Location	Trap Number	Trap Priority
Reset Functions: – Hardware Reset – Software Reset – W-dog Timer Overflow	–	RESET RESET RESET	00'0000 _H 00'0000 _H 00'0000 _H	00 _H 00 _H 00 _H	III III III

Capture/Compare (CAPCOM) Units

The CAPCOM units support generation and control of timing sequences on up to 32 channels with a maximum resolution of 16 TCL. The CAPCOM units are typically used to handle high speed I/O tasks such as pulse and waveform generation, pulse width modulation (PMW), Digital to Analog (D/A) conversion, software timing, or time recording relative to external events.

Four 16-bit timers (T0/T1, T7/T8) with reload registers provide two independent time bases for the capture/compare register array.

The input clock for the timers is programmable to several prescaled values of the internal system clock, or may be derived from an overflow/underflow of timer T6 in module GPT2. This provides a wide range of variation for the timer period and resolution and allows precise adjustments to the application specific requirements. In addition, external count inputs for CAPCOM timers T0 and T7 allow event scheduling for the capture/compare registers relative to external events.

Both of the two capture/compare register arrays contain 16 dual purpose capture/compare registers, each of which may be individually allocated to either CAPCOM timer T0 or T1 (T7 or T8, respectively), and programmed for capture or compare function. Each register has one port pin associated with it which serves as an input pin for triggering the capture function, or as an output pin to indicate the occurrence of a compare event.

When a capture/compare register has been selected for capture mode, the current contents of the allocated timer will be latched ('capture'd) into the capture/compare register in response to an external event at the port pin which is associated with this register. In addition, a specific interrupt request for this capture/compare register is generated. Either a positive, a negative, or both a positive and a negative external signal transition at the pin can be selected as the triggering event. The contents of all registers which have been selected for one of the five compare modes are continuously compared with the contents of the allocated timers. When a match occurs between the timer value and the value in a capture/compare register, specific actions will be taken based on the selected compare mode.

Table 5 Compare Modes (CAPCOM)

Compare Modes	Function
Mode 0	Interrupt-only compare mode; several compare interrupts per timer period are possible
Mode 1	Pin toggles on each compare match; several compare events per timer period are possible
Mode 2	Interrupt-only compare mode; only one compare interrupt per timer period is generated
Mode 3	Pin set '1' on match; pin reset '0' on compare time overflow; only one compare event per timer period is generated
Double Register Mode	Two registers operate on one pin; pin toggles on each compare match; several compare events per timer period are possible.

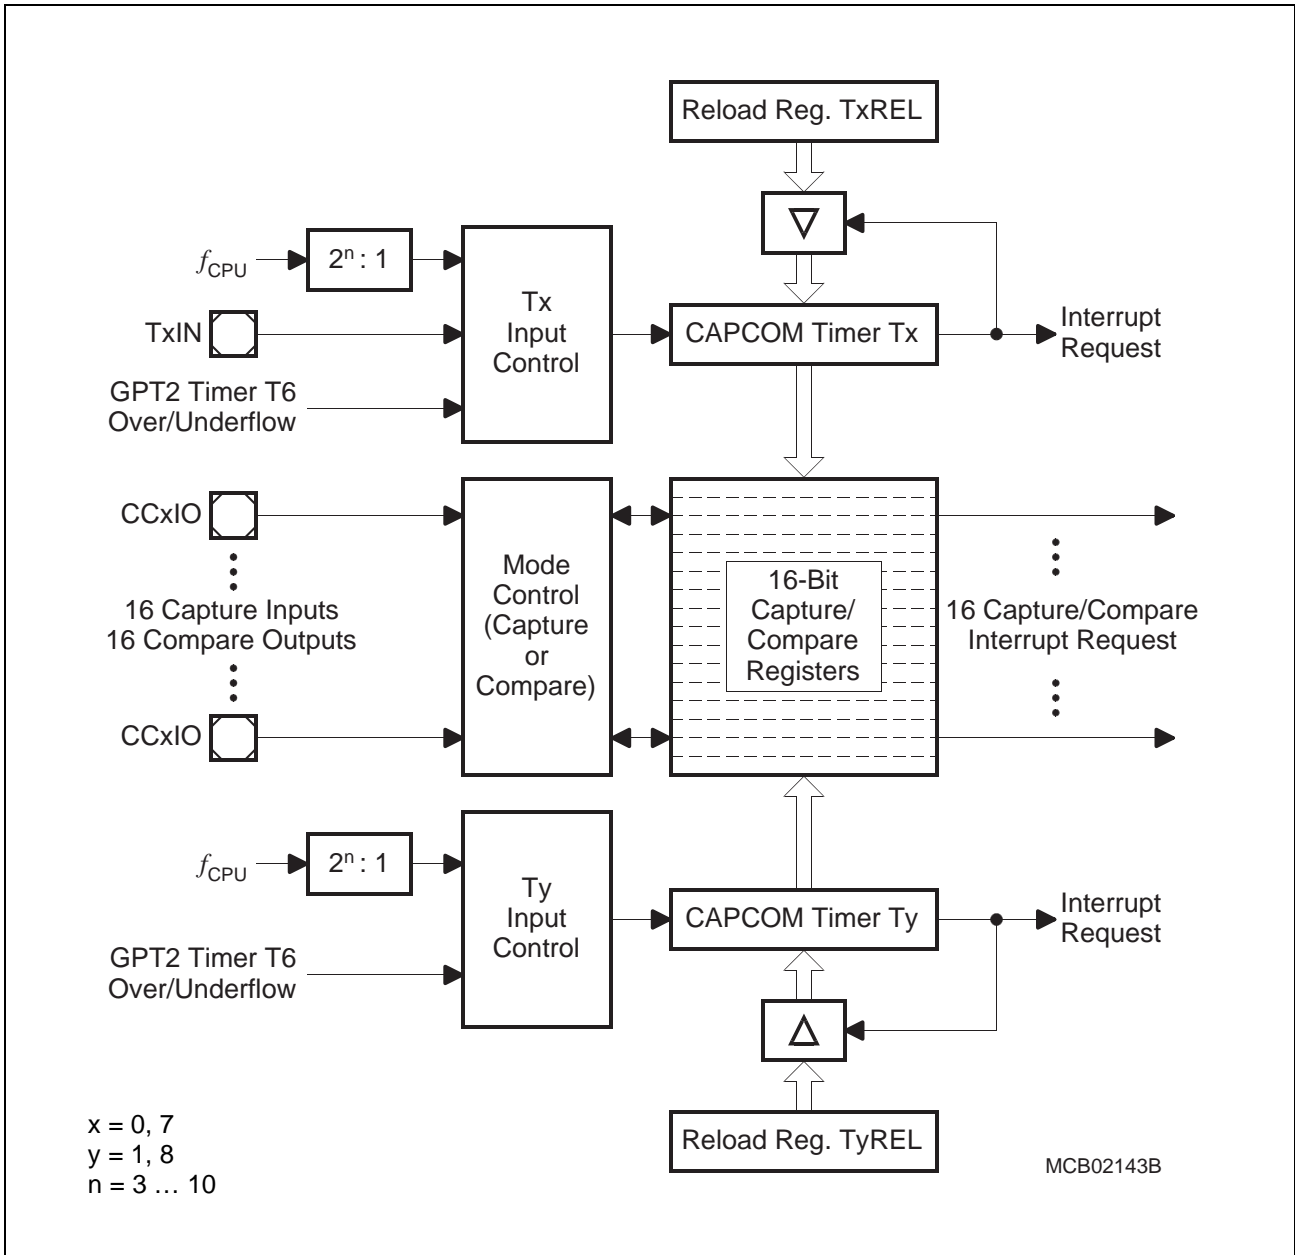

Figure 5 CAPCOM Unit Block Diagram

PWM Module

The Pulse Width Modulation Module can generate up to four PWM output signals using edge-aligned or center-aligned PWM. In addition the PWM module can generate PWM burst signals and single shot outputs. The frequency range of the PWM signals covers 4 Hz to 16.5 MHz (referred to a CPU clock of 33 MHz), depending on the resolution of the PWM output signal. The level of the output signals is selectable and the PWM module can generate interrupt requests.

General Purpose Timer (GPT) Unit

The GPT unit represents a very flexible multifunctional timer/counter structure which may be used for many different time related tasks such as event timing and counting, pulse width and duty cycle measurements, pulse generation, or pulse multiplication.

The GPT unit incorporates five 16-bit timers which are organized in two separate modules, GPT1 and GPT2. Each timer in each module may operate independently in a number of different modes, or may be concatenated with another timer of the same module.

Each of the three timers T2, T3, T4 of **module GPT1** can be configured individually for one of four basic modes of operation, which are Timer, Gated Timer, Counter, and Incremental Interface Mode. In Timer Mode, the input clock for a timer is derived from the CPU clock, divided by a programmable prescaler, while Counter Mode allows a timer to be clocked in reference to external events.

Pulse width or duty cycle measurement is supported in Gated Timer Mode, where the operation of a timer is controlled by the 'gate' level on an external input pin. For these purposes, each timer has one associated port pin (TxIN) which serves as gate or clock input. The maximum resolution of the timers in module GPT1 is 16 TCL.

The count direction (up/down) for each timer is programmable by software or may additionally be altered dynamically by an external signal on a port pin (TxEUD) to facilitate e.g. position tracking.

In Incremental Interface Mode the GPT1 timers (T2, T3, T4) can be directly connected to the incremental position sensor signals A and B via their respective inputs TxIN and TxEUD. Direction and count signals are internally derived from these two input signals, so the contents of the respective timer Tx corresponds to the sensor position. The third position sensor signal TOP0 can be connected to an interrupt input.

Timer T3 has an output toggle latch (T3OTL) which changes its state on each timer overflow/underflow. The state of this latch may be output on pin T3OUT e.g. for time out monitoring of external hardware components, or may be used internally to clock timers T2 and T4 for measuring long time periods with high resolution.

In addition to their basic operating modes, timers T2 and T4 may be configured as reload or capture registers for timer T3. When used as capture or reload registers, timers T2 and T4 are stopped. The contents of timer T3 is captured into T2 or T4 in response to a signal at their associated input pins (TxIN). Timer T3 is reloaded with the contents of T2 or T4 triggered either by an external signal or by a selectable state transition of its toggle latch T3OTL. When both T2 and T4 are configured to alternately reload T3 on opposite state transitions of T3OTL with the low and high times of a PWM signal, this signal can be constantly generated without software intervention.

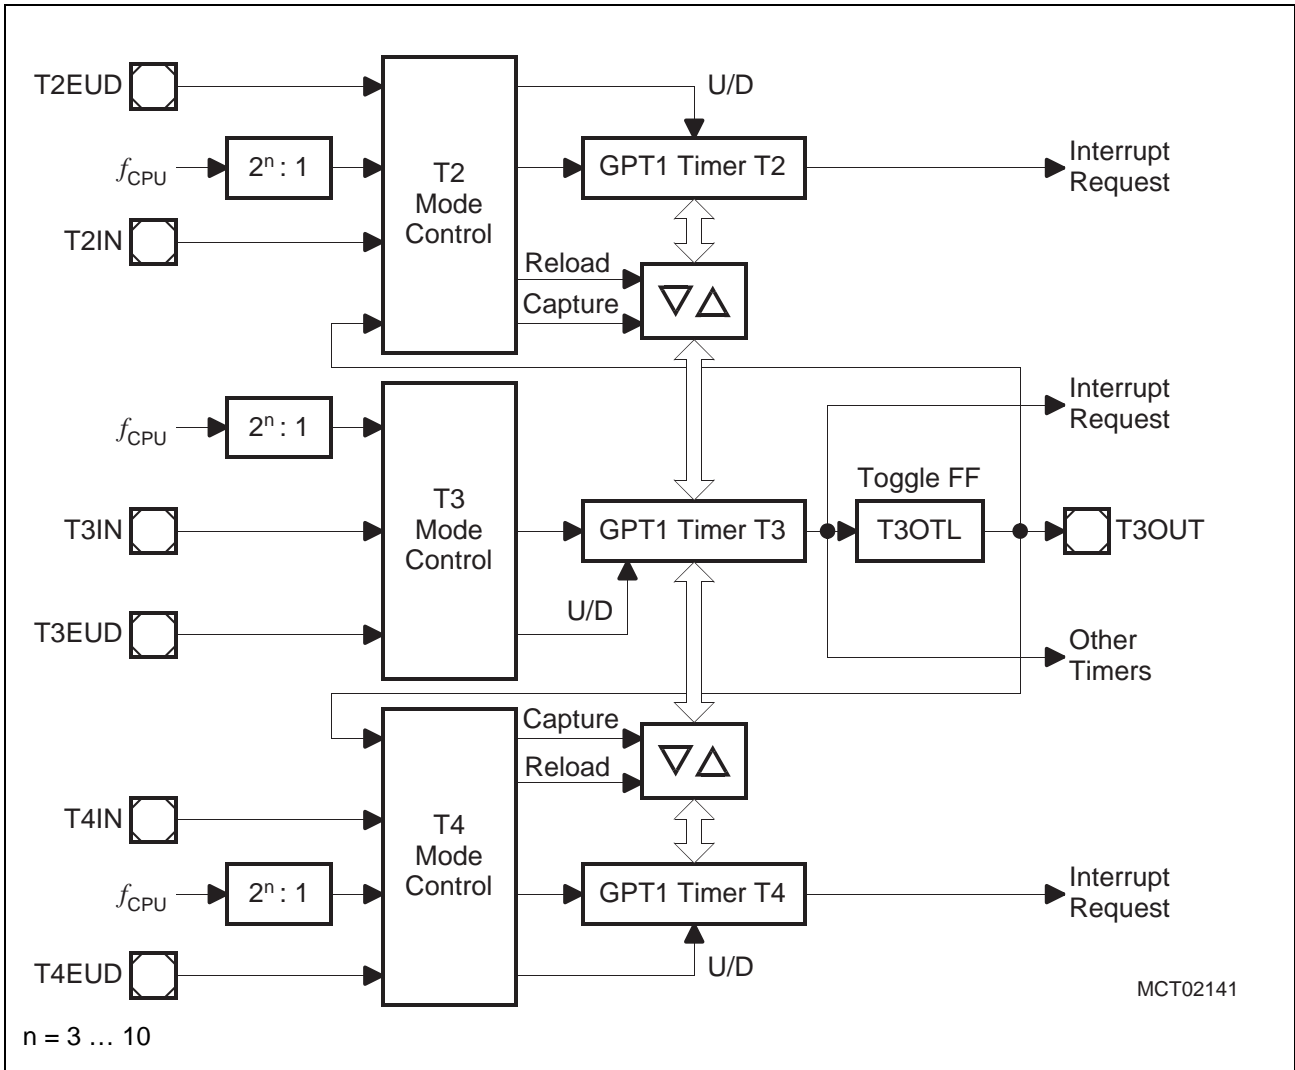

Figure 6 Block Diagram of GPT1

With its maximum resolution of 8 TCL, the **GPT2 module** provides precise event control and time measurement. It includes two timers (T5, T6) and a capture/reload register (CAPREL). Both timers can be clocked with an input clock which is derived from the CPU clock via a programmable prescaler or with external signals. The count direction (up/down) for each timer is programmable by software or may additionally be altered dynamically by an external signal on a port pin (TxEUD). Concatenation of the timers is supported via the output toggle latch (T6OTL) of timer T6, which changes its state on each timer overflow/underflow.

The state of this latch may be used to clock timer T5, and/or it may be output on pin T6OUT. The overflows/underflows of timer T6 can additionally be used to clock the CAPCOM timers T0 or T1, and to cause a reload from the CAPREL register. The CAPREL register may capture the contents of timer T5 based on an external signal transition on the corresponding port pin (CAPIN), and timer T5 may optionally be cleared

after the capture procedure. This allows the C167CS to measure absolute time differences or to perform pulse multiplication without software overhead.

The capture trigger (timer T5 to CAPREL) may also be generated upon transitions of GPT1 timer T3's inputs T3IN and/or T3EUD. This is especially advantageous when T3 operates in Incremental Interface Mode.

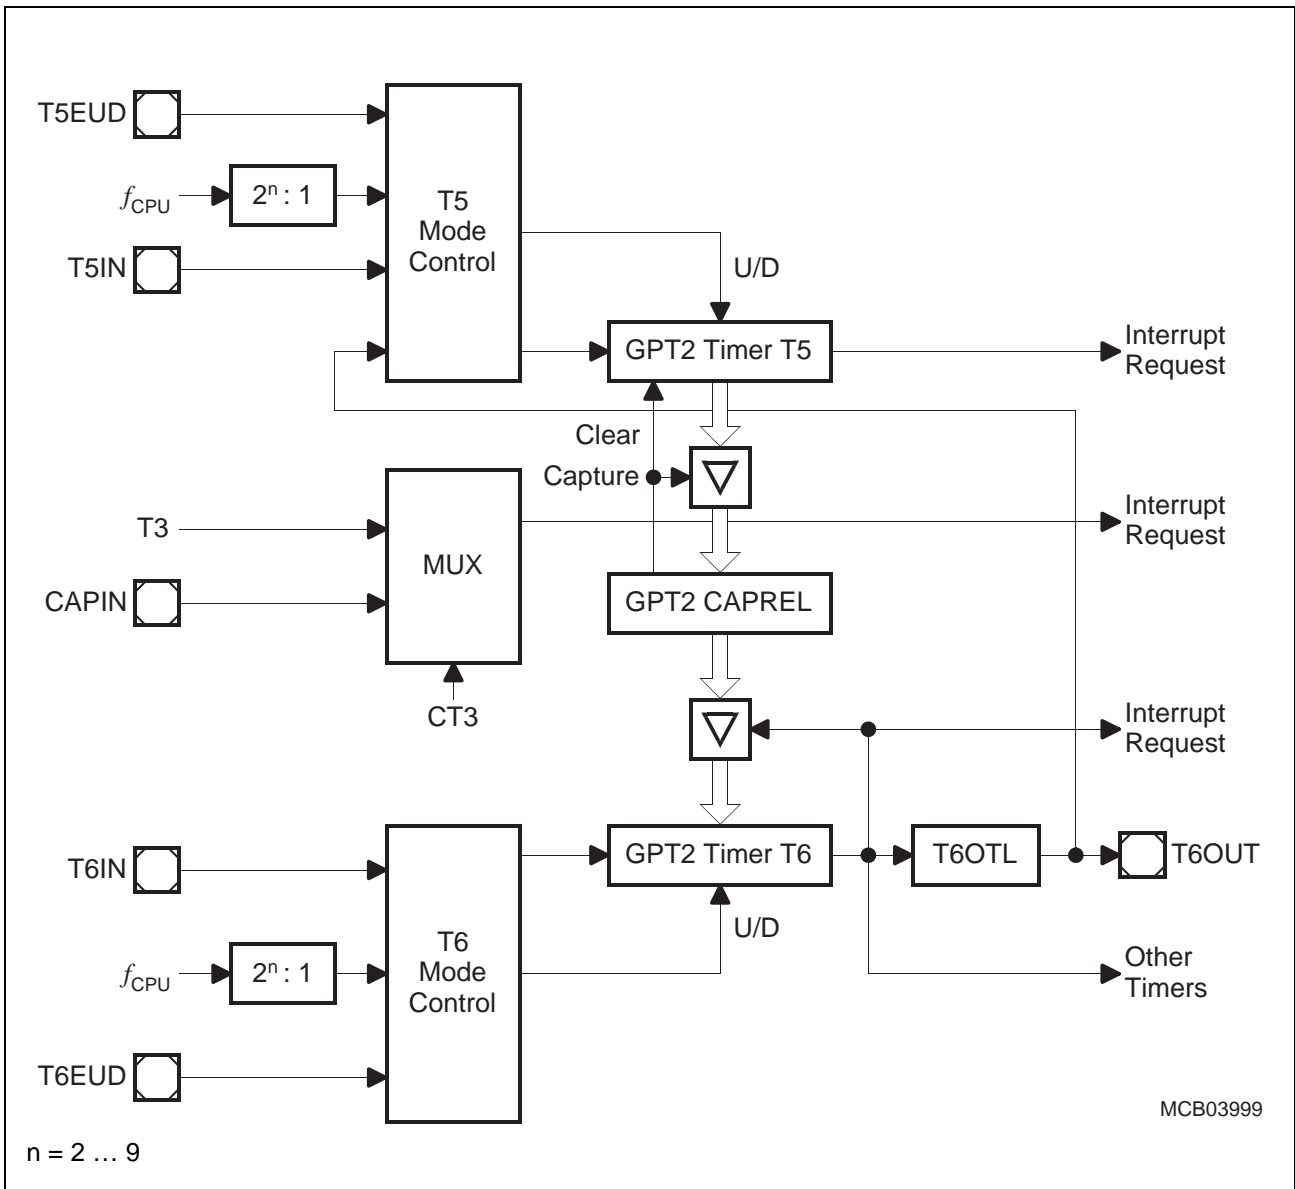

Figure 7 Block Diagram of GPT2

Real Time Clock

The Real Time Clock (RTC) module of the C167CS consists of a chain of 3 divider blocks, a fixed 8:1 divider, the reloadable 16-bit timer T14, and the 32-bit RTC timer (accessible via registers RTCH and RTCL). The RTC module is directly clocked with the on-chip oscillator frequency divided by 32 via a separate clock driver ($f_{RTC} = f_{OSC}/32$) and is therefore independent from the selected clock generation mode of the C167CS. All timers count up.

The RTC module can be used for different purposes:

- System clock to determine the current time and date
- Cyclic time based interrupt
- 48-bit timer for long term measurements

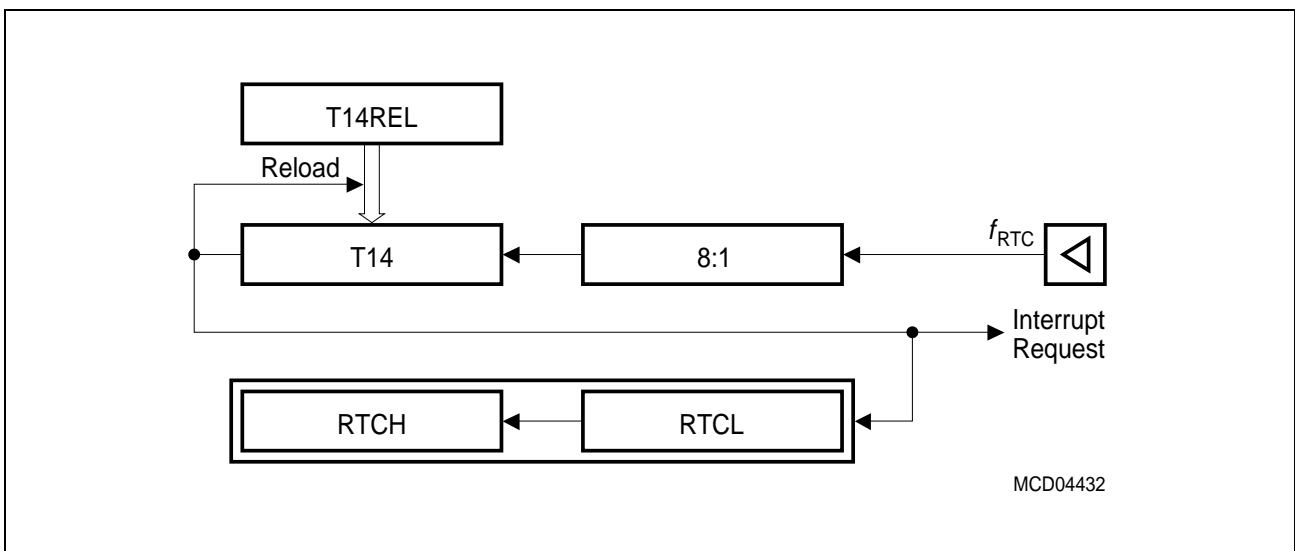

Figure 8 RTC Block Diagram

Note: The registers associated with the RTC are not affected by a reset in order to maintain the correct system time even when intermediate resets are executed.

A/D Converter

For analog signal measurement, a 10-bit A/D converter with 24 multiplexed input channels (16 standard channels and 8 extension channels) and a sample and hold circuit has been integrated on-chip. It uses the method of successive approximation. The sample time (for loading the capacitors) and the conversion time is programmable and can so be adjusted to the external circuitry.

Overflow error detection/protection is provided for the conversion result register (ADDAT): either an interrupt request will be generated when the result of a previous conversion has not been read from the result register at the time the next conversion is complete, or the next conversion is suspended in such a case until the previous result has been read.

For applications which require less than 24 analog input channels, the remaining channel inputs can be used as digital input port pins.

The A/D converter of the C167CS supports four different conversion modes. In the standard Single Channel conversion mode, the analog level on a specified channel is sampled once and converted to a digital result. In the Single Channel Continuous mode, the analog level on a specified channel is repeatedly sampled and converted without software intervention. In the Auto Scan mode, the analog levels on a prespecified number of channels (standard or extension) are sequentially sampled and converted. In the Auto Scan Continuous mode, the number of prespecified channels is repeatedly sampled and converted. In addition, the conversion of a specific channel can be inserted (injected) into a running sequence without disturbing this sequence. This is called Channel Injection Mode.

The Peripheral Event Controller (PEC) may be used to automatically store the conversion results into a table in memory for later evaluation, without requiring the overhead of entering and exiting interrupt routines for each data transfer.

After each reset and also during normal operation the ADC automatically performs calibration cycles. This automatic self-calibration constantly adjusts the converter to changing operating conditions (e.g. temperature) and compensates process variations.

These calibration cycles are part of the conversion cycle, so they do not affect the normal operation of the A/D converter.

In order to decouple analog inputs from digital noise and to avoid input trigger noise those pins used for analog input can be disconnected from the digital IO or input stages under software control. This can be selected for each pin separately via registers P5DIDIS (Port 5 Digital Input Disable) and P1DIDIS (PORT1 Digital Input Disable).

Serial Channels

Serial communication with other microcontrollers, processors, terminals or external peripheral components is provided by two serial interfaces with different functionality, an Asynchronous/Synchronous Serial Channel (**ASC0**) and a High-Speed Synchronous Serial Channel (**SSC**).

The ASC0 is upward compatible with the serial ports of the Infineon 8-bit microcontroller families and supports full-duplex asynchronous communication at up to 781 KBaud/1.03 MBaud and half-duplex synchronous communication at up to 3.1/4.1 MBaud (@ 25/33 MHz CPU clock).

A dedicated baud rate generator allows to set up all standard baud rates without oscillator tuning. For transmission, reception and error handling 4 separate interrupt vectors are provided. In asynchronous mode, 8- or 9-bit data frames are transmitted or received, preceded by a start bit and terminated by one or two stop bits. For multiprocessor communication, a mechanism to distinguish address from data bytes has been included (8-bit data plus wake up bit mode).

In synchronous mode, the ASC0 transmits or receives bytes (8 bits) synchronously to a shift clock which is generated by the ASC0. The ASC0 always shifts the LSB first. A loop back option is available for testing purposes.

A number of optional hardware error detection capabilities has been included to increase the reliability of data transfers. A parity bit can automatically be generated on transmission or be checked on reception. Framing error detection allows to recognize data frames with missing stop bits. An overrun error will be generated, if the last character received has not been read out of the receive buffer register at the time the reception of a new character is complete.

The SSC supports full-duplex synchronous communication at up to 6.25/8.25 MBaud (@ 25/33 MHz CPU clock). It may be configured so it interfaces with serially linked peripheral components. A dedicated baud rate generator allows to set up all standard baud rates without oscillator tuning. For transmission, reception and error handling 3 separate interrupt vectors are provided.

The SSC transmits or receives characters of 2 ... 16 bits length synchronously to a shift clock which can be generated by the SSC (master mode) or by an external master (slave mode). The SSC can start shifting with the LSB or with the MSB and allows the selection of shifting and latching clock edges as well as the clock polarity.

A number of optional hardware error detection capabilities has been included to increase the reliability of data transfers. Transmit and receive error supervise the correct handling of the data buffer. Phase and baudrate error detect incorrect serial data.

CAN-Modules

The integrated CAN-Modules handle the completely autonomous transmission and reception of CAN frames in accordance with the CAN specification V2.0 part B (active), i.e. the on-chip CAN-Modules can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers.

The modules provide Full CAN functionality on up to 15 message objects each. Message object 15 may be configured for Basic CAN functionality. Both modes provide separate masks for acceptance filtering which allows to accept a number of identifiers in Full CAN mode and also allows to disregard a number of identifiers in Basic CAN mode. All message objects can be updated independent from the other objects and are equipped for the maximum message length of 8 bytes.

The bit timing is derived from the XCLK and is programmable up to a data rate of 1 MBaud. Each CAN-Module uses two pins of Port 4 or Port 8 to interface to an external bus transceiver. The interface pins are assigned via software.

Module CAN2 is identical with the first one, except that it uses a separate address area and a separate interrupt node.

The two CAN modules can be internally coupled by assigning their interface pins to the same two port pins, or they can interface to separate CAN buses.

Note: When any CAN interface is assigned to Port 4, the respective segment address lines on Port 4 cannot be used. This will limit the external address space.

Watchdog Timer

The Watchdog Timer represents one of the fail-safe mechanisms which have been implemented to prevent the controller from malfunctioning for longer periods of time.

The Watchdog Timer is always enabled after a reset of the chip, and can only be disabled in the time interval until the EINIT (end of initialization) instruction has been executed. Thus, the chip's start-up procedure is always monitored. The software has to be designed to service the Watchdog Timer before it overflows. If, due to hardware or software related failures, the software fails to do so, the Watchdog Timer overflows and generates an internal hardware reset and pulls the $\overline{\text{RSTOUT}}$ pin low in order to allow external hardware components to be reset.

The Watchdog Timer is a 16-bit timer, clocked with the system clock divided by 2/4/128/256. The high byte of the Watchdog Timer register can be set to a prespecified reload value (stored in WDTREL) in order to allow further variation of the monitored time interval. Each time it is serviced by the application software, the high byte of the Watchdog Timer is reloaded. Thus, time intervals between 15.5 μs and 508 ms can be monitored (@ 33 MHz).

The default Watchdog Timer interval after reset is 3.97 ms (@ 33 MHz).

Parallel Ports

The C167CS provides up to 111 I/O lines which are organized into eight input/output ports and one input port. All port lines are bit-addressable, and all input/output lines are individually (bit-wise) programmable as inputs or outputs via direction registers. The I/O ports are true bidirectional ports which are switched to high impedance state when configured as inputs. The output drivers of five I/O ports can be configured (pin by pin) for push/pull operation or open-drain operation via control registers. During the internal reset, all port pins are configured as inputs.

The input threshold of Port 2, Port 3, Port 7, and Port 8 is selectable (TTL or CMOS like), where the special CMOS like input threshold reduces noise sensitivity due to the input hysteresis. The input threshold may be selected individually for each byte of the respective ports.

All port lines have programmable alternate input or output functions associated with them. All port lines that are not used for these alternate functions may be used as general purpose IO lines.

PORT0 and PORT1 may be used as address and data lines when accessing external memory, while Port 4 outputs the additional segment address bits A23/19/17 ... A16 in systems where segmentation is enabled to access more than 64 KBytes of memory.

Port 2, Port 8 and Port 7 (and parts of PORT1) are associated with the capture inputs or compare outputs of the CAPCOM units and/or with the outputs of the PWM module.

Port 6 provides optional bus arbitration signals (BREQ, HLDA, HOLD) and chip select signals.

Port 3 includes alternate functions of timers, serial interfaces, the optional bus control signal BHE, and the system clock output CLKOUT (or the programmable frequency output FOUT).

Port 5 (and parts of PORT1) is used for the analog input channels to the A/D converter or timer control signals.

The edge characteristics (transition time) and driver characteristics (output current) of the C167CS's port drivers can be selected via the Port Output Control registers (POCONx).

Oscillator Watchdog

The Oscillator Watchdog (OWD) monitors the clock signal generated by the on-chip oscillator (either with a crystal or via external clock drive). For this operation the PLL provides a clock signal which is used to supervise transitions on the oscillator clock. This PLL clock is independent from the XTAL1 clock. When the expected oscillator clock transitions are missing the OWD activates the PLL Unlock/OWD interrupt node and supplies the CPU with the PLL clock signal. Under these circumstances the PLL will oscillate with its basic frequency.

In direct drive mode the PLL base frequency is used directly ($f_{\text{CPU}} = 2 \dots 5 \text{ MHz}$).

In prescaler mode the PLL base frequency is divided by 2 ($f_{\text{CPU}} = 1 \dots 2.5 \text{ MHz}$).

Note: The CPU clock source is only switched back to the oscillator clock after a hardware reset.

The oscillator watchdog can be disabled by setting bit OWDDIS in register SYSCON. In this case (OWDDIS = '1') the PLL remains idle and provides no clock signal, while the CPU clock signal is derived directly from the oscillator clock or via prescaler or SDD. Also no interrupt request will be generated in case of a missing oscillator clock.

Note: At the end of a reset bit OWDDIS reflects the inverted level of pin \overline{RD} at that time. Thus the oscillator watchdog may also be disabled via hardware by (externally) pulling the \overline{RD} line low upon a reset, similar to the standard reset configuration via PORT0.

Power Management

The C167CS provides several means to control the power it consumes either at a given time or averaged over a certain timespan. Three mechanisms can be used (partly in parallel):

- **Power Saving Modes** switch the C167CS into a special operating mode (control via instructions).
Idle Mode stops the CPU while the peripherals can continue to operate.
Sleep Mode and Power Down Mode stop all clock signals and all operation (RTC may optionally continue running). Sleep Mode can be terminated by external interrupt signals.
- **Clock Generation Management** controls the distribution and the frequency of internal and external clock signals (control via register SYSCON2).
Slow Down Mode lets the C167CS run at a CPU clock frequency of $f_{OSC}/1 \dots 32$ (half for prescaler operation) which drastically reduces the consumed power. The PLL can be optionally disabled while operating in Slow Down Mode.
External circuitry can be controlled via the programmable frequency output FOUT.
- **Peripheral Management** permits temporary disabling of peripheral modules (control via register SYSCON3).
Each peripheral can separately be disabled/enabled. A group control option disables a major part of the peripheral set by setting one single bit.

The on-chip RTC supports intermittennd operation of the C167CS by generating cyclic wakeup signals. This offers full performance to quickly react on action requests while the intermittennd sleep phases greatly reduce the average power consumption of the system.

Instruction Set Summary

Table 6 lists the instructions of the C167CS in a condensed way.

The various addressing modes that can be used with a specific instruction, the operation of the instructions, parameters for conditional execution of instructions, and the opcodes for each instruction can be found in the “**C166 Family Instruction Set Manual**”.

This document also provides a detailed description of each instruction.

Table 6 Instruction Set Summary

Mnemonic	Description	Bytes
ADD(B)	Add word (byte) operands	2 / 4
ADDC(B)	Add word (byte) operands with Carry	2 / 4
SUB(B)	Subtract word (byte) operands	2 / 4
SUBC(B)	Subtract word (byte) operands with Carry	2 / 4
MUL(U)	(Un)Signed multiply direct GPR by direct GPR (16-16-bit)	2
DIV(U)	(Un)Signed divide register MDL by direct GPR (16-/16-bit)	2
DIVL(U)	(Un)Signed long divide reg. MD by direct GPR (32-/16-bit)	2
CPL(B)	Complement direct word (byte) GPR	2
NEG(B)	Negate direct word (byte) GPR	2
AND(B)	Bitwise AND, (word/byte operands)	2 / 4
OR(B)	Bitwise OR, (word/byte operands)	2 / 4
XOR(B)	Bitwise XOR, (word/byte operands)	2 / 4
BCLR	Clear direct bit	2
BSET	Set direct bit	2
BMOV(N)	Move (negated) direct bit to direct bit	4
BAND, BOR, BXOR	AND/OR/XOR direct bit with direct bit	4
BCMP	Compare direct bit to direct bit	4
BFLDH/L	Bitwise modify masked high/low byte of bit-addressable direct word memory with immediate data	4
CMP(B)	Compare word (byte) operands	2 / 4
CMPD1/2	Compare word data to GPR and decrement GPR by 1/2	2 / 4
CMPI1/2	Compare word data to GPR and increment GPR by 1/2	2 / 4
PRIOR	Determine number of shift cycles to normalize direct word GPR and store result in direct word GPR	2
SHL / SHR	Shift left/right direct word GPR	2
ROL / ROR	Rotate left/right direct word GPR	2
ASHR	Arithmetic (sign bit) shift right direct word GPR	2

Table 6 Instruction Set Summary (cont'd)

Mnemonic	Description	Bytes
MOV(B)	Move word (byte) data	2 / 4
MOVBS	Move byte operand to word operand with sign extension	2 / 4
MOVBZ	Move byte operand to word operand. with zero extension	2 / 4
JMPA, JMPI, JMPR	Jump absolute/indirect/relative if condition is met	4
JMPS	Jump absolute to a code segment	4
J(N)B	Jump relative if direct bit is (not) set	4
JBC	Jump relative and clear bit if direct bit is set	4
JNBS	Jump relative and set bit if direct bit is not set	4
CALLA, CALLI, CALLR	Call absolute/indirect/relative subroutine if condition is met	4
CALLS	Call absolute subroutine in any code segment	4
PCALL	Push direct word register onto system stack and call absolute subroutine	4
TRAP	Call interrupt service routine via immediate trap number	2
PUSH, POP	Push/pop direct word register onto/from system stack	2
SCXT	Push direct word register onto system stack und update register with word operand	4
RET	Return from intra-segment subroutine	2
RETS	Return from inter-segment subroutine	2
RETP	Return from intra-segment subroutine and pop direct word register from system stack	2
RETI	Return from interrupt service subroutine	2
SRST	Software Reset	4
IDLE	Enter Idle Mode	4
PWRDN	Enter Power Down Mode (supposes NMI-pin being low)	4
SRVWDT	Service Watchdog Timer	4
DISWDT	Disable Watchdog Timer	4
EINIT	Signify End-of-Initialization on RSTOUT-pin	4
ATOMIC	Begin ATOMIC sequence	2
EXTR	Begin EXTended Register sequence	2
EXTP(R)	Begin EXTended Page (and Register) sequence	2 / 4
EXTS(R)	Begin EXTended Segment (and Register) sequence	2 / 4
NOP	Null operation	2

Special Function Registers Overview

Table 7 lists all SFRs which are implemented in the C167CS in alphabetical order.

Bit-addressable SFRs are marked with the letter “b” in column “Name”. SFRs within the **Extended SFR-Space** (ESFRs) are marked with the letter “E” in column “Physical Address”. Registers within on-chip X-peripherals are marked with the letter “X” in column “Physical Address”.

An SFR can be specified via its individual mnemonic name. Depending on the selected addressing mode, an SFR can be accessed via its physical address (using the Data Page Pointers), or via its short 8-bit address (without using the Data Page Pointers).

Table 7 C167CS Registers, Ordered by Name

Absolute Maximum Ratings

Table 8 Absolute Maximum Rating Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Storage temperature	T_{ST}	- 65	150	°C	-
Junction temperature	T_J	- 40	150	°C	under bias
Voltage on V_{DD} pins with respect to ground (V_{SS})	V_{DD}	- 0.5	6.5	V	-
Voltage on any pin with respect to ground (V_{SS})	V_{IN}	- 0.5	$V_{DD} + 0.5$	V	-
Input current on any pin during overload condition	-	- 10	10	mA	-
Absolute sum of all input currents during overload condition	-	-	100	mA	-
Power dissipation	P_{DISS}	-	1.5	W	-

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ($V_{IN} > V_{DD}$ or $V_{IN} < V_{SS}$) the voltage on V_{DD} pins with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation of the C167CS. All parameters specified in the following sections refer to these operating conditions, unless otherwise noticed.

Table 9 Operating Condition Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Digital supply voltage	V_{DD}	4.5	5.5	V	Active mode, $f_{CPU_{max}} = 33 \text{ MHz}$
		2.5 ¹⁾	5.5	V	PowerDown mode
Digital ground voltage	V_{SS}	0		V	Reference voltage
Overload current	I_{OV}	–	± 5	mA	Per pin ²⁾³⁾
Absolute sum of overload currents	$\Sigma I_{OV} $	–	50	mA	³⁾
External Load Capacitance	C_L	–	50	pF	Pin drivers in fast edge mode ⁴⁾
Ambient temperature	T_A	0	70	°C	SAB-C167CS ...
		– 40	85	°C	SAF-C167CS ...
		– 40	125	°C	SAK-C167CS ...

1) Output voltages and output currents will be reduced when V_{DD} leaves the range defined for active mode.

2) Overload conditions occur if the standard operating conditions are exceeded, i.e. the voltage on any pin exceeds the specified range (i.e. $V_{OV} > V_{DD} + 0.5 \text{ V}$ or $V_{OV} < V_{SS} - 0.5 \text{ V}$). The absolute sum of input overload currents on all pins may not exceed **50 mA**. The supply voltage must remain within the specified limits. Proper operation is not guaranteed if overload conditions occur on functional pins line XTAL1, RD, WR, etc.

3) Not 100% tested, guaranteed by design and characterization.

4) The timing is valid for pin drivers in high current or dynamic current mode. The reduced static output current in dynamic current mode must be respected when designing the system.

Parameter Interpretation

The parameters listed in the following partly represent the characteristics of the C167CS and partly its demands on the system. To aid in interpreting the parameters right, when evaluating them for a design, they are marked in column "Symbol":

CC (Controller Characteristics):

The logic of the C167CS will provide signals with the respective timing characteristics.

SR (System Requirement):

The external system must provide signals with the respective timing characteristics to the C167CS.

DC Characteristics

(Operating Conditions apply)¹⁾

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Input low voltage (TTL, all except XTAL1)	V_{IL} SR	-0.5	$0.2 V_{DD} - 0.1$	V	-

Pin capacitance ¹⁰⁾ (digital inputs/outputs)	C_{IO} CC	–	10	pF	$f = 1 \text{ MHz}$ $T_A = 25 \text{ }^\circ\text{C}$

1) Keeping signal levels within the levels specified in this table, ensures operation without overload conditions. For signal levels outside these specifications also refer to the specification of the overload current I_{OV} .

2) Valid in bidirectional reset mode only.

3) This output current may be drawn from (output) pins operating in High Current mode.

4) This output current may be drawn from (output) pins operating in Low Current mode.

5) This specification is not valid for outputs which are switched to open drain mode. In this case the respective output will float and the voltage results from the external circuitry.

6) These parameters describe the RSTIN pullup, which equals a resistance of ca. 50 to 250 k Ω .

7) The maximum current may be drawn while the respective signal line remains inactive.

- 8) The minimum current must be drawn in order to drive the respective signal line active.
- 9) This specification is only valid during Reset, or during Hold- or Adapt-mode. During Hold mode Port 6 pins are only affected, if they are used (configured) for \overline{CS} output and the open drain function is not enabled.
- 10) Not 100% tested, guaranteed by design and characterization.

Power Consumption C167CS

(Operating Conditions apply)

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Power supply current (active) with all peripherals active	I_{DD}	–	20 + $3.2 \times f_{CPU}$	mA	$\overline{RSTIN} = V_{IL2}$ f_{CPU} in [MHz] ¹⁾
Idle mode supply current with all peripherals active	I_{IDX}	–	15 + $1.4 \times f_{CPU}$	mA	$\overline{RSTIN} = V_{IH1}$ f_{CPU} in [MHz] ¹⁾
Idle mode supply current with all peripherals deactivated, PLL off, SDD factor = 32	I_{IDO} ²⁾	–	500 + $50 \times f_{OSC}$	μA	$\overline{RSTIN} = V_{IH1}$ f_{OSC} in [MHz] ¹⁾
Sleep and Power-down mode supply current with RTC running	I_{PDR} ²⁾	–	200 + $25 \times f_{OSC}$	μA	$V_{DD} = V_{DDmax}$ f_{OSC} in [MHz] ³⁾
Sleep and Power-down mode supply current with RTC disabled	I_{PDO}	–	50	μA	$V_{DD} = V_{DDmax}$ ³⁾

- 1) The supply current is a function of the operating frequency. This dependency is illustrated in [Figure 10](#). These parameters are tested at V_{DDmax} and maximum CPU clock with all outputs disconnected and all inputs at V_{IL} or V_{IH} .
- 2) This parameter is determined mainly by the current consumed by the oscillator (see [Figure 9](#)). This current, however, is influenced by the external oscillator circuitry (crystal, capacitors). The values given refer to a typical circuitry and may change in case of a not optimized external oscillator circuitry.
- 3) This parameter is tested including leakage currents. All inputs (including pins configured as inputs) at 0 V to 0.1 V or at $V_{DD} - 0.1$ V to V_{DD} , $V_{REF} = 0$ V, all outputs (including pins configured as outputs) disconnected.

Figure 9 Idle and Power Down Supply Current as a Function of Oscillator Frequency

Figure 10 Supply/Idle Current as a Function of Operating Frequency

AC Characteristics

Definition of Internal Timing

The internal operation of the C167CS is controlled by the internal CPU clock f_{CPU} . Both edges of the CPU clock can trigger internal (e.g. pipeline) or external (e.g. bus cycles) operations.

The specification of the external timing (AC Characteristics) therefore depends on the time between two consecutive edges of the CPU clock, called "TCL" (see [Figure 11](#)).

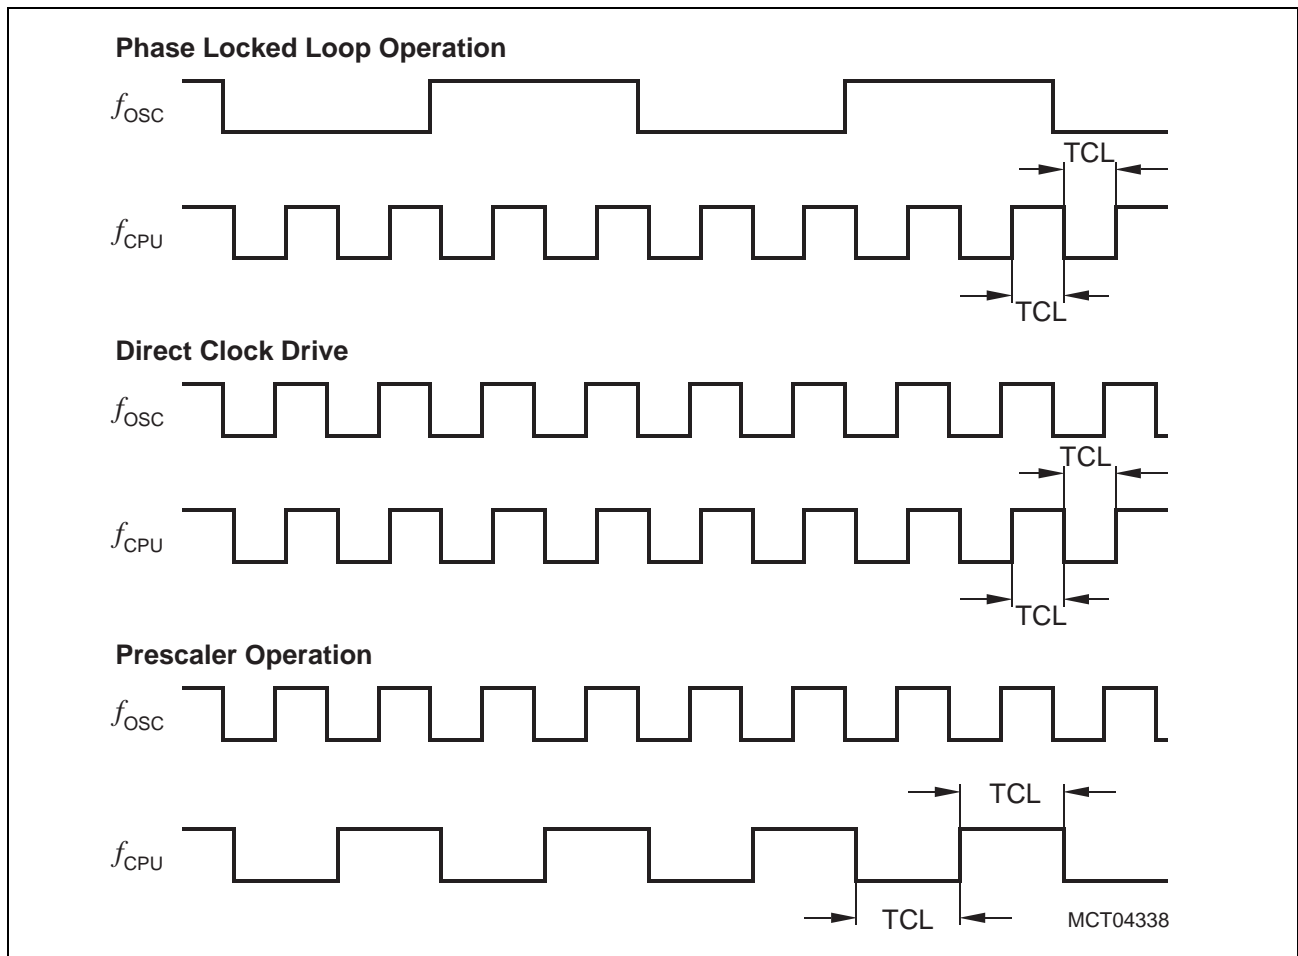

Figure 11 Generation Mechanisms for the CPU Clock

The CPU clock signal f_{CPU} can be generated from the oscillator clock signal f_{OSC} via different mechanisms. The duration of TCLs and their variation (and also the derived external timing) depends on the used mechanism to generate f_{CPU} . This influence must be regarded when calculating the timings for the C167CS.

Note: The example for PLL operation shown in [Figure 11](#) refers to a PLL factor of 4.

The used mechanism to generate the basic CPU clock is selected by bitfield CLKCFG in register RP0H.7-5.

Upon a long hardware reset register RP0H is loaded with the logic levels present on the upper half of PORT0 (P0H), i.e. bitfield CLKCFG represents the logic levels on pins

P0.15-13 (P0H.7-5). Register RP0H can be loaded from the upper half of register RSTCON under software control.

Table 10 associates the combinations of these three bits with the respective clock generation mode.

Table 10 C167CS Clock Generation Modes

CLKCFG (RP0H.7-5)	CPU Frequency $f_{CPU} = f_{OSC} \times F$	External Clock Input Range ¹⁾	Notes
1 1 1	$f_{OSC} \times 4$	2.5 to 8.25 MHz	Default configuration
1 1 0	$f_{OSC} \times 3$	3.33 to 11 MHz	–
1 0 1	$f_{OSC} \times 2$	5 to 16.5 MHz	–
1 0 0	$f_{OSC} \times 5$	2 to 6.6 MHz	–
0 1 1	$f_{OSC} \times 1$	1 to 33 MHz	Direct drive ²⁾
0 1 0	$f_{OSC} \times 1.5$	6.66 to 22 MHz	–
0 0 1	$f_{OSC} / 2$	2 to 66 MHz	CPU clock via prescaler
0 0 0	$f_{OSC} \times 2.5$	4 to 13.2 MHz	–

1) The external clock input range refers to a CPU clock range of 10 ... 33 MHz.

2) The maximum frequency depends on the duty cycle of the external clock signal.

Prescaler Operation

When prescaler operation is configured (CLKCFG=001_B) the CPU clock is derived from the internal oscillator (input clock signal) by a 2:1 prescaler.

The frequency of f_{CPU} is half the frequency of f_{OSC} and the high and low time of f_{CPU} (i.e. the duration of an individual TCL) is defined by the period of the input clock f_{OSC} .

The timings listed in the AC Characteristics that refer to TCLs therefore can be calculated using the period of f_{OSC} for any TCL.

Phase Locked Loop

When PLL operation is configured (via CLKCFG) the on-chip phase locked loop is enabled and provides the CPU clock (see table above). The PLL multiplies the input frequency by the factor **F** which is selected via the combination of pins P0.15-13 (i.e. $f_{CPU} = f_{OSC} \times F$). With every **F**'th transition of f_{OSC} the PLL circuit synchronizes the CPU clock to the input clock. This synchronization is done smoothly, i.e. the CPU clock frequency does not change abruptly.

Due to this adaptation to the input clock the frequency of f_{CPU} is constantly adjusted so it is locked to f_{OSC} . The slight variation causes a jitter of f_{CPU} which also effects the duration of individual TCLs.

The timings listed in the AC Characteristics that refer to TCLs therefore must be calculated using the minimum TCL that is possible under the respective circumstances. The actual minimum value for TCL depends on the jitter of the PLL. As the PLL is constantly adjusting its output frequency so it corresponds to the applied input frequency (crystal or oscillator) the relative deviation for periods of more than one TCL is lower than for one single TCL (see formula and [Figure 12](#)). For a period of $N \times \text{TCL}$ the minimum value is computed using the corresponding deviation D_N :

$$(N \times \text{TCL})_{\min} = N \times \text{TCL}_{\text{NOM}} - D_N; D_N [\text{ns}] = \pm (13.3 + N \times 6.3) / f_{\text{CPU}} [\text{MHz}],$$

where N = number of consecutive TCLs and $1 \leq N \leq 40$.

So for a period of 3 TCLs @ 25 MHz (i.e. $N = 3$): $D_3 = (13.3 + 3 \times 6.3) / 25 = 1.288 \text{ ns}$, and $(3\text{TCL})_{\min} = 3\text{TCL}_{\text{NOM}} - 1.288 \text{ ns} = 58.7 \text{ ns}$ (@ $f_{\text{CPU}} = 25 \text{ MHz}$).

This is especially important for bus cycles using waitstates and e.g. for the operation of timers, serial interfaces, etc. For all slower operations and longer periods (e.g. pulse train generation or measurement, lower baudrates, etc.) the deviation caused by the PLL jitter is neglectable.

Note: For all periods longer than 40 TCL the $N=40$ value can be used (see [Figure 12](#)).

Figure 12 **Approximated Maximum Accumulated PLL Jitter**

Direct Drive

When direct drive is configured (CLKCFG = 011_B) the on-chip phase locked loop is disabled and the CPU clock is directly driven from the internal oscillator with the input clock signal.

The frequency of f_{CPU} directly follows the frequency of f_{OSC} so the high and low time of f_{CPU} (i.e. the duration of an individual TCL) is defined by the duty cycle of the input clock f_{OSC} .

The timings listed below that refer to TCLs therefore must be calculated using the minimum TCL that is possible under the respective circumstances. This minimum value can be calculated via the following formula:

$$TCL_{min} = 1/f_{OSC} \times DC_{min} \quad (DC = \text{duty cycle})$$

For two consecutive TCLs the deviation caused by the duty cycle of f_{OSC} is compensated so the duration of 2TCL is always $1/f_{OSC}$. The minimum value TCL_{min} therefore has to be used only once for timings that require an odd number of TCLs (1, 3, ...). Timings that require an even number of TCLs (2, 4, ...) may use the formula $2TCL = 1/f_{OSC}$.

AC Characteristics
External Clock Drive XTAL1
(Operating Conditions apply)

Table 11 External Clock Drive Characteristics

Parameter	Symbol	Direct Drive 1:1		Prescaler 2:1		PLL 1:N		Unit
		min.	max.	min.	max.	min.	max.	
Oscillator period	t_{OSC} SR	30	–	15	–	45 ¹⁾	500 ¹⁾	ns
High time ²⁾	t_1 SR	15 ³⁾	–	5	–	10	–	ns
Low time ²⁾	t_2 SR	15 ³⁾	–	5	–	10	–	ns
Rise time ²⁾	t_3 SR	–	8	–	5	–	10	ns
Fall time ²⁾	t_4 SR	–	8	–	5	–	10	ns

- 1) The minimum and maximum oscillator periods for PLL operation depend on the selected CPU clock generation mode. Please see respective table above.
- 2) The clock input signal must reach the defined levels V_{IL2} and V_{IH2} .
- 3) The minimum high and low time refers to a duty cycle of 50%. The maximum operating frequency (f_{CPU}) in direct drive mode depends on the duty cycle of the clock input signal.

Figure 13 External Clock Drive XTAL1

Note: If the on-chip oscillator is used together with a crystal, the oscillator frequency is limited to a range of 4 MHz to 40 MHz.

It is strongly recommended to measure the oscillation allowance (or margin) in the final target system (layout) to determine the optimum parameters for the oscillator operation. Please refer to the limits specified by the crystal supplier.

When driven by an external clock signal it will accept the specified frequency range. Operation at lower input frequencies is possible but is guaranteed by design only (not 100% tested).

A/D Converter Characteristics

(Operating Conditions apply)

Table 12 A/D Converter Characteristics

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Analog reference supply	V_{AREF} SR	4.0	$V_{DD} + 0.1$	V	1)
Analog reference ground	V_{AGND} SR	$V_{SS} - 0.1$	$V_{SS} + 0.2$	V	–
Analog input voltage range	V_{AIN} SR	V_{AGND}	V_{AREF}	V	2)
Basic clock frequency	f_{BC}	0.5	6.25	MHz	3)
Conversion time	t_C CC	–	$40 t_{BC} + t_S + 2t_{CPU}$	–	4) $t_{CPU} = 1/f_{CPU}$
Calibration time after reset	t_{CAL} CC	–	$3328 t_{BC}$	–	5)
Total unadjusted error	TUE CC ¹⁾	–	± 2	LSB	Channels 0 ... 15
		–	± 10	LSB	Channels 16 ... 23
Internal resistance of reference voltage source	R_{AREF} SR	–	$t_{BC}/60 - 0.25$	k Ω	t_{BC} in [ns] ⁶⁾⁷⁾
Internal resistance of analog source	R_{ASRC} SR	–	$t_S/450 - 0.25$	k Ω	t_S in [ns] ⁷⁾⁸⁾
ADC input capacitance	C_{AIN} CC	–	33	pF	7)

1) TUE is tested at $V_{AREF} = 5.0$ V, $V_{AGND} = 0$ V, $V_{DD} = 4.9$ V. It is guaranteed by design for all other voltages within the defined voltage range.

If the analog reference supply voltage exceeds the power supply voltage by up to 0.2 V

(i.e. $V_{AREF} = V_{DD} + 0.2$ V) the maximum TUE is increased to $\pm 3/11$ LSB. This range is not 100% tested.

The specified TUE is guaranteed only if the absolute sum of input overload currents on Port 5 pins (see I_{OV} specification) does not exceed 10 mA.

During the reset calibration sequence the maximum TUE may be ± 4 LSB (± 12 LSB for channels 16 ... 23).

2) V_{AIN} may exceed V_{AGND} or V_{AREF} up to the absolute maximum ratings. However, the conversion result in these cases will be X000_H or X3FF_H, respectively.

3) The limit values for f_{BC} must not be exceeded when selecting the CPU frequency and the ADCTC setting.

4) This parameter includes the sample time t_S , the time for determining the digital result and the time to load the result register with the conversion result.

Values for the basic clock t_{BC} depend on programming and can be taken from [Table 13](#).

This parameter depends on the ADC control logic. It is not a real maximum value, but rather a fixum.

5) During the reset calibration conversions can be executed (with the current accuracy). The time required for these conversions is added to the total reset calibration time.

- 6) During the conversion the ADC's capacitance must be repeatedly charged or discharged. The internal resistance of the reference voltage source must allow the capacitance to reach its respective voltage level within each conversion step. The maximum internal resistance results from the programmed conversion timing.
- 7) Not 100% tested, guaranteed by design and characterization.
- 8) During the sample time the input capacitance C_{AIN} can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S . After the end of the sample time t_S , changes of the analog input voltage have no effect on the conversion result. Values for the sample time t_S depend on programming and can be taken from [Table 13](#).

Sample time and conversion time of the C167CS's A/D Converter are programmable. [Table 13](#) should be used to calculate the above timings. The limit values for f_{BC} must not be exceeded when selecting ADCTC.

Table 13 A/D Converter Computation Table

ADCON.15 14 (ADCTC)	A/D Converter Basic Clock f_{BC}	ADCON.13 12 (ADSTC)	Sample time t_S
00	$f_{CPU}/4$	00	$t_{BC} \times 8$
01	$f_{CPU}/2$	01	$t_{BC} \times 16$
10	$f_{CPU}/16$	10	$t_{BC} \times 32$
11	$f_{CPU}/8$	11	$t_{BC} \times 64$

Converter Timing Example:

Assumptions: $f_{CPU} = 25 \text{ MHz}$ (i.e. $t_{CPU} = 40 \text{ ns}$), ADCTC = '00', ADSTC = '00'.
 Basic clock $f_{BC} = f_{CPU}/4 = 6.25 \text{ MHz}$, i.e. $t_{BC} = 160 \text{ ns}$.
 Sample time $t_S = t_{BC} \times 8 = 1280 \text{ ns}$.
 Conversion time $t_C = t_S + 40 t_{BC} + 2 t_{CPU} = (1280 + 6400 + 80) \text{ ns} = 7.8 \mu\text{s}$.

Testing Waveforms

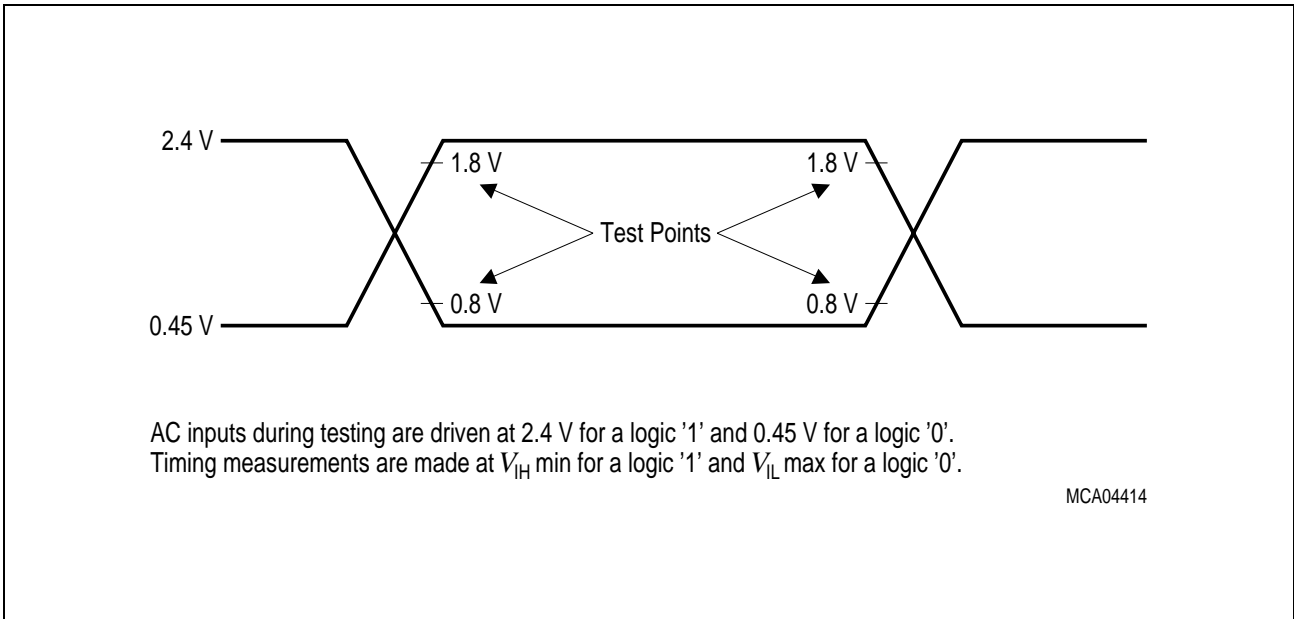

Figure 14 Input Output Waveforms

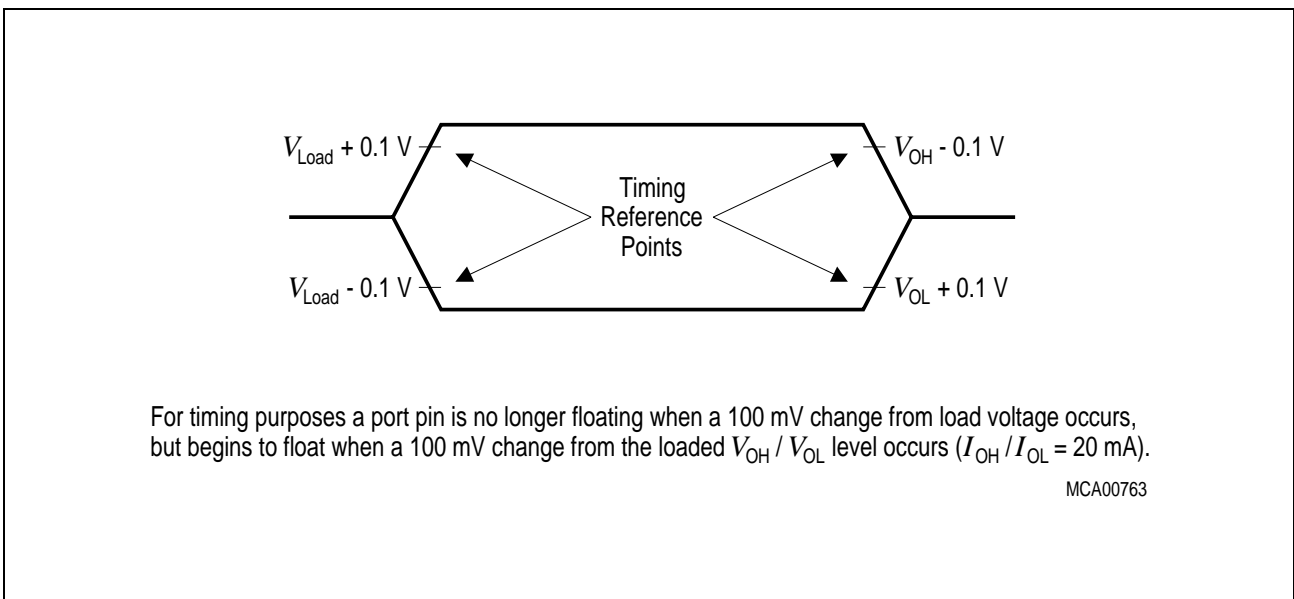

Figure 15 Float Waveforms

AC Characteristics

Table 14 CLKOUT Reference Signal

Parameter	Symbol	Limits		Unit
		min.	max.	
CLKOUT cycle time	t_{c5} CC	30 ¹⁾		ns
CLKOUT high time	t_{c6} CC	8	–	ns
CLKOUT low time	t_{c7} CC	6	–	ns
CLKOUT rise time	t_{c8} CC	–	4	ns
CLKOUT fall time	t_{c9} CC	–	4	ns

- 1) The CLKOUT cycle time is influenced by the PLL jitter.
 For a single CLKOUT cycle (2 TCL) the deviation caused by the PLL jitter is below 1 ns (for $f_{CPU} > 25$ MHz).
 For longer periods the relative deviation decreases (see PLL deviation formula).

Figure 16 CLKOUT Signal Timing

Variable Memory Cycles

The bus timing shown below is programmable via the BUSCONx registers. The duration of ALE and two types of waitstates can be selected. This table summarizes the possible bus cycle durations.

Table 15 Variable Memory Cycles

Bus Cycle Type	Bus Cycle Duration	Unit	25/33 MHz, 0 Waitstates
Demultiplexed bus cycle with normal ALE	$4 + 2 \times (15 - \langle MCTC \rangle) + 2 \times (1 - \langle MTTC \rangle)$	TCL	80 ns / 60.6 ns
Demultiplexed bus cycle with extended ALE	$6 + 2 \times (15 - \langle MCTC \rangle) + 2 \times (1 - \langle MTTC \rangle)$	TCL	120 ns / 90.9 ns
Multiplexed bus cycle with normal ALE	$6 + 2 \times (15 - \langle MCTC \rangle) + 2 \times (1 - \langle MTTC \rangle)$	TCL	120 ns / 90.9 ns
Multiplexed bus cycle with extended ALE	$8 + 2 \times (15 - \langle MCTC \rangle) + 2 \times (1 - \langle MTTC \rangle)$	TCL	160 ns / 121.2 ns

Table 16 External Bus Cycle Timing (Operating Conditions apply)

Parameter	Symbol	Limits		Unit
		min.	max.	
Output delay from CLKOUT falling edge Valid for: address (MUX on PORT0), write data out	t_{c10} CC	1	15	ns
Output delay from $\overline{\text{CLKOUT}}$ edge Valid for: latched $\overline{\text{CS}}$, ALE (normal)	t_{c11} CC	-3	6	ns
Output delay from $\overline{\text{CLKOUT}}$ edge Valid for: $\overline{\text{WR}}$, $\overline{\text{WRL}}$, $\overline{\text{WRH}}$, $\overline{\text{WrCS}}$	t_{c12} CC	-3	7	ns
Output delay from $\overline{\text{CLKOUT}}$ edge Valid for: $\overline{\text{RD}}$, $\overline{\text{RdCS}}$	t_{c13} CC	-1	7	ns
Input setup time to CLKOUT falling edge Valid for: read data in	t_{c14} SR	12	-	ns
Input hold time after CLKOUT falling edge Valid for: read data in ¹⁾	t_{c15} SR	-1	-	ns
Output delay from CLKOUT falling edge Valid for: address (on PORT1 and/or P4), $\overline{\text{BHE}}$	t_{c16} CC	1	12	ns
Output hold time after CLKOUT falling edge Valid for: address, $\overline{\text{BHE}}$ ²⁾	t_{c17} CC	-1	10	ns
Output hold time after CLKOUT edge ³⁾ Valid for: write data out	t_{c18} CC	0	-	ns
Output delay from $\overline{\text{CLKOUT}}$ falling edge Valid for: ALE (extended), early $\overline{\text{CS}}$	t_{c19} CC	-5	7	ns
Turn off delay after $\overline{\text{CLKOUT}}$ edge ³⁾ Valid for: write data out	t_{c20} CC	-	7	ns
Turn on delay after $\overline{\text{CLKOUT}}$ falling edge ³⁾ Valid for: write data out	t_{c21} CC	-5	-	ns
Output hold time after $\overline{\text{CLKOUT}}$ edge Valid for: early $\overline{\text{CS}}$	t_{c22} CC	-6	4	ns

1) Read data are latched with the same (internal) clock edge that triggers the address change and the rising edge of RD. Therefore address changes before the end of RD have no impact on (demultiplexed) read cycles.

2) Due to comparable propagation delays the address does not change before $\overline{\text{WR}}$ goes high. The minimum output delay ($t_{c17\text{min}}$) is therefore the actual value of t_{c12} .

3) Not 100% tested, guaranteed by design and characterization.

General Notes For The Following Timing Figures

These standard notes apply to all subsequent timing figures. Additional individual notes are placed at the respective figure.

- 1) The falling edge of signals \overline{RD} and $\overline{WR}/\overline{WRH}/\overline{WRL}/\overline{WrCS}$ is controlled by the Read/Write delay feature (bit BUSCON.RWDCx).
- 2) The rising edge of signal $\overline{WR}/\overline{WRH}/\overline{WRL}/\overline{WrCS}$ is controlled by the early write feature (bit BUSCON.EWENx).
- 3) A bus cycle is extended here, if MCTC waitstates are selected or if the READY input is sampled inactive.
- 4) A bus cycle is extended here, if an MTTC waitstate is selected.

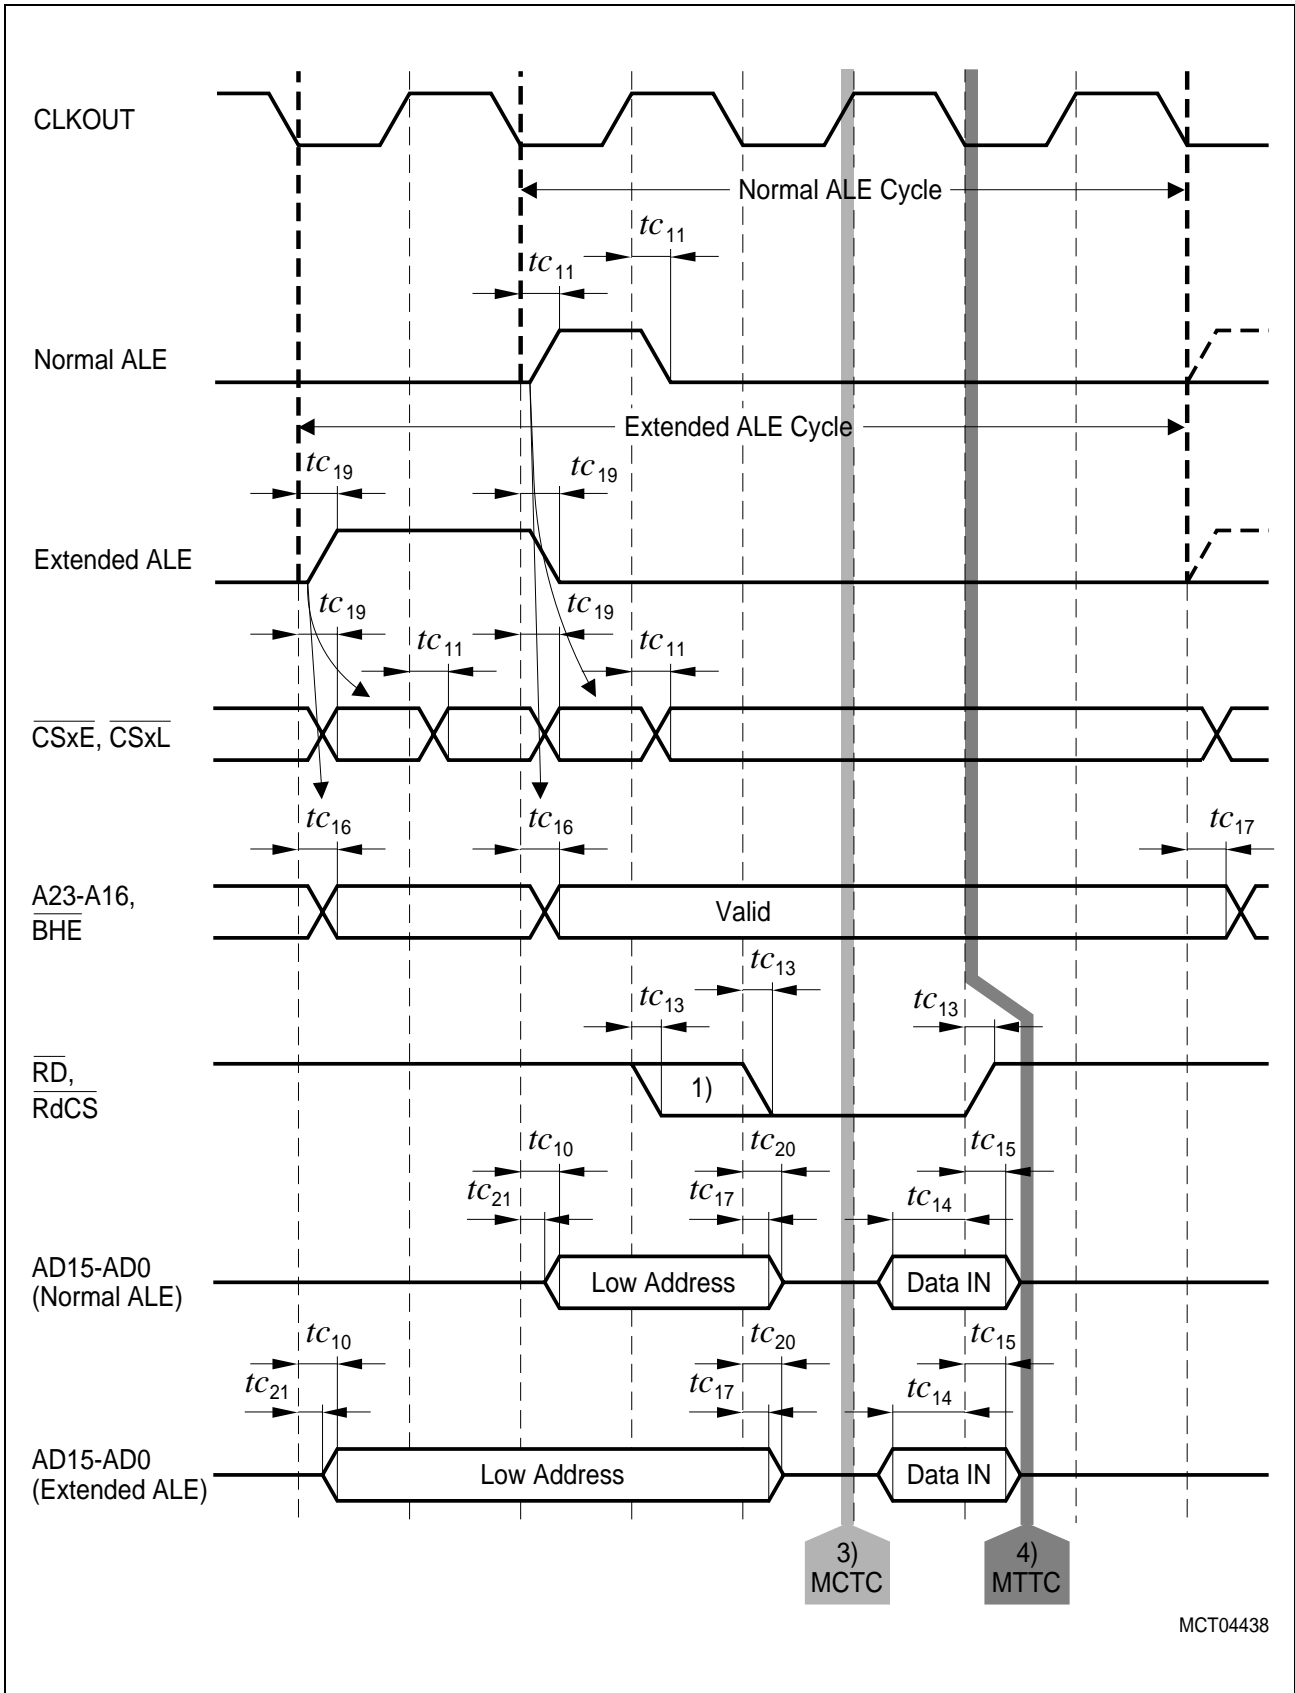

Figure 20 Multiplexed Bus, Read Access

Bus Cycle Control via $\overline{\text{READY}}$ Input

The duration of an external bus cycle can be controlled by the external circuitry via the $\overline{\text{READY}}$ input signal.

Synchronous $\overline{\text{READY}}$ permits the shortest possible bus cycle but requires the input signal to be synchronous to the reference signal CLKOUT.

Asynchronous $\overline{\text{READY}}$ puts no timing constraints on the input signal but incurs one waitstate minimum due to the additional synchronization stage.

Table 17 $\overline{\text{READY}}$ Timing (Operating Conditions apply)

Parameter	Symbol	Limits		Unit
		min	max	
Input setup time to CLKOUT rising edge Valid for: $\overline{\text{READY}}$ input	t_{c25} CC	15	–	ns
Input hold time after CLKOUT rising edge Valid for: $\overline{\text{READY}}$ input	t_{c26} CC	0	–	ns
Asynchronous $\overline{\text{READY}}$ input low time ⁶⁾	t_{c27} CC	$t_{c5} + t_{c25}$	–	ns

Notes (Valid also for [Figure 21](#))

- 4) Cycle as programmed, including MCTC waitstates (Example shows 0 MCTC WS).
- 5) $\overline{\text{READY}}$ sampled HIGH at this sampling point generates a $\overline{\text{READY}}$ controlled waitstate, $\overline{\text{READY}}$ sampled LOW at this sampling point terminates the currently running bus cycle.
- 6) These timings are given for test purposes only, in order to assure recognition at a specific clock edge. If the Asynchronous $\overline{\text{READY}}$ signal does not fulfill the indicated setup and hold times with respect to CLKOUT, it must fulfill t_{c27} in order to be safely synchronized. Proper deactivation of $\overline{\text{READY}}$ is guaranteed if $\overline{\text{READY}}$ is deactivated in response to the trailing (rising) edge of the corresponding command (RD or WR).
- 7) Multiplexed bus modes have a MUX waitstate added after a bus cycle, and an additional MTTC waitstate may be inserted here. For a multiplexed bus **with** MTTC waitstate this delay is 2 CLKOUT cycles, for a demultiplexed bus **without** MTTC waitstate this delay is zero.
- 8) If the next following bus cycle is $\overline{\text{READY}}$ controlled, an active $\overline{\text{READY}}$ signal must be disabled before the first valid sample point for the next bus cycle. This sample point depends on the MTTC waitstate of the current cycle, and on the MCTC waitstates and the ALE mode of the next following cycle. If the current cycle uses a multiplexed bus the intrinsic MUX waitstate adds another CLKOUT cycle to the $\overline{\text{READY}}$ deactivation time.

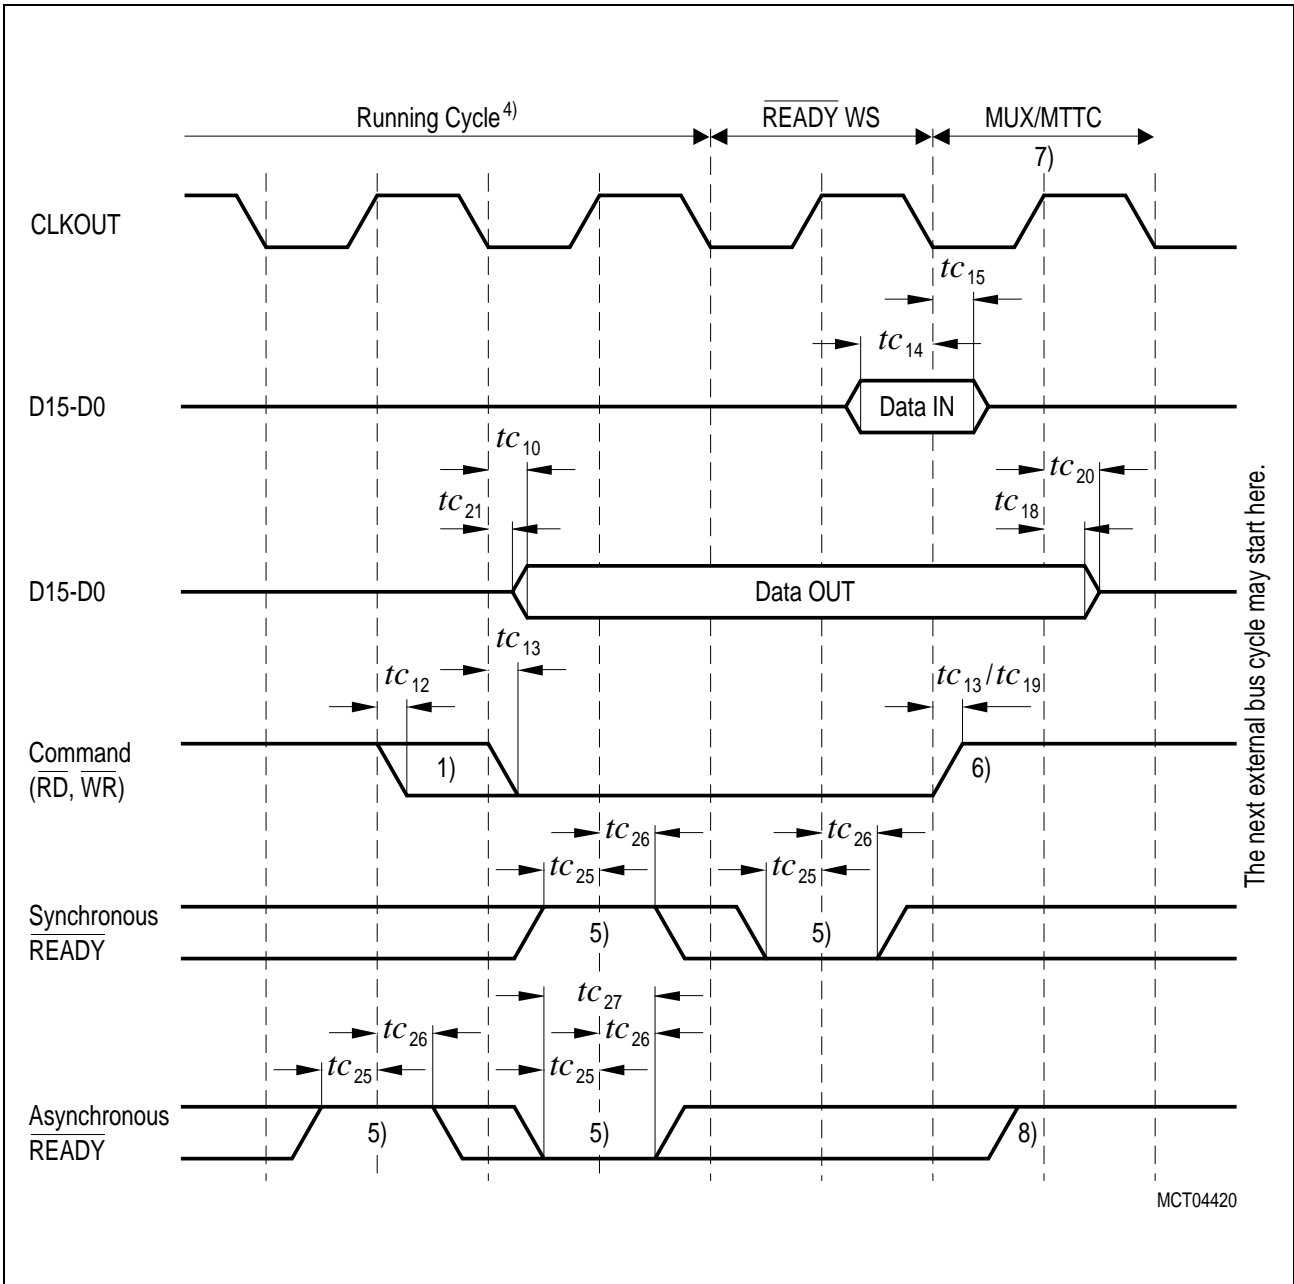

Figure 21 **READY Timing**

External Bus Arbitration

Table 18 Bus Arbitration Timing (Operating Conditions apply)

Parameter	Symbol	Limits		Unit
		min.	max.	
HOLD input setup time to CLKOUT falling edge	t_{c28} SR	15	–	ns
CLKOUT to $\overline{\text{BREQ}}$ delay	t_{c29} CC	–3	6	ns
CLKOUT to $\overline{\text{HLDA}}$ delay	t_{c30} CC	–2	6	ns
$\overline{\text{CSx}}$ release ¹⁾	t_{c31} CC	0	10	ns
$\overline{\text{CSx}}$ drive	t_{c32} CC	–3	4	ns
Other signals release ¹⁾	t_{c33} CC	0	10	ns
Other signals drive ¹⁾	t_{c34} CC	0	6	ns

¹⁾ Not 100% tested, guaranteed by design and characterization.

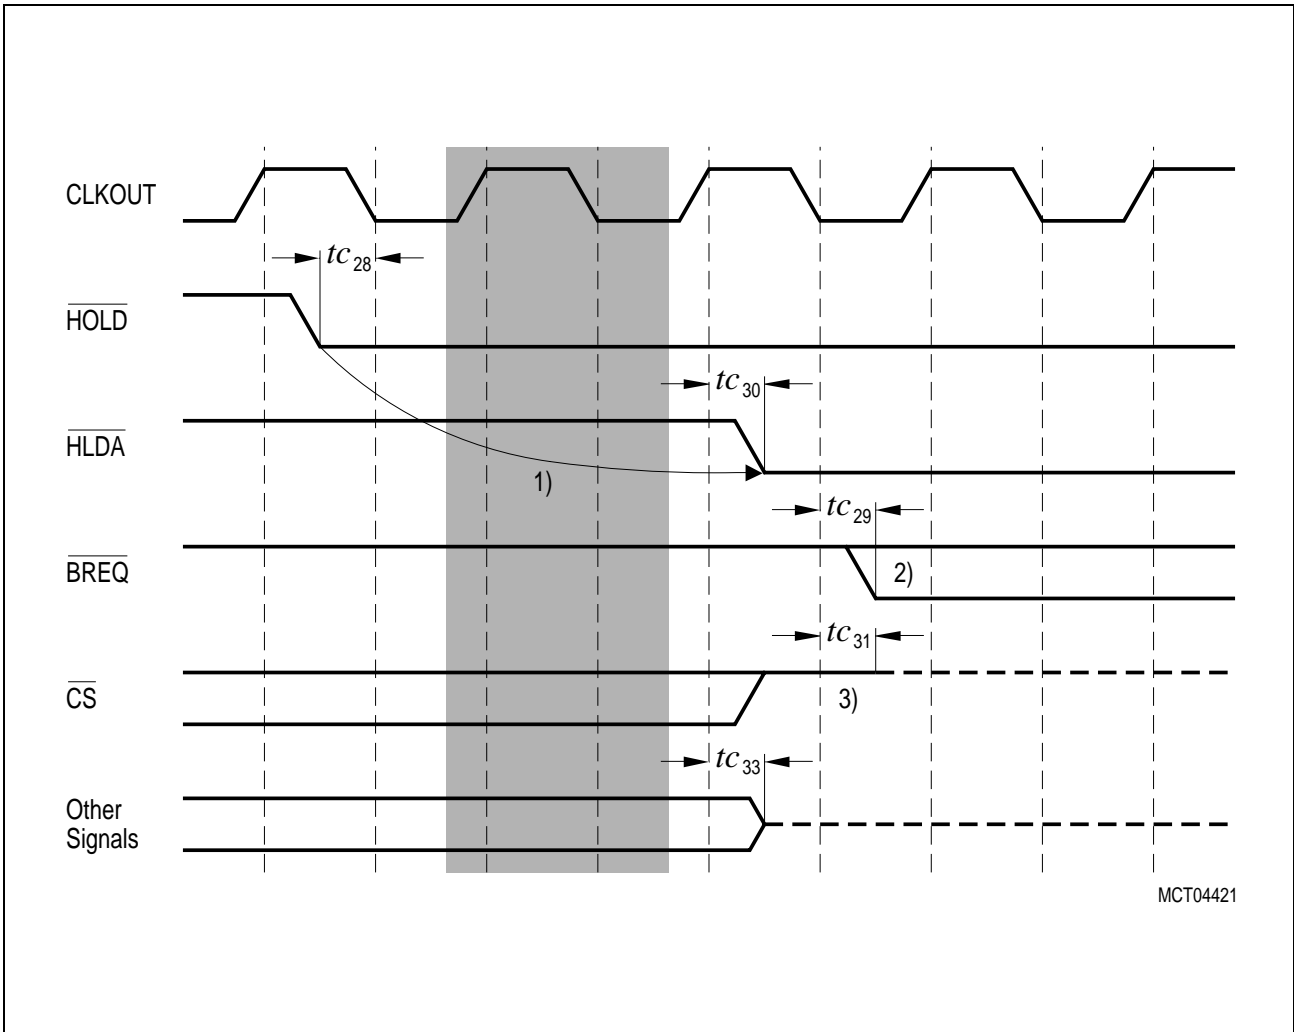

Figure 22 External Bus Arbitration, Releasing the Bus

Notes

- 1) The C167CS will complete the currently running bus cycle before granting bus access.
- 2) This is the first possibility for BREQ to get active.
- 3) The CS outputs will be resistive high (pullup) after t_{c33} . Latched CS outputs are driven high for 1 TCL before the output drivers are switched off.

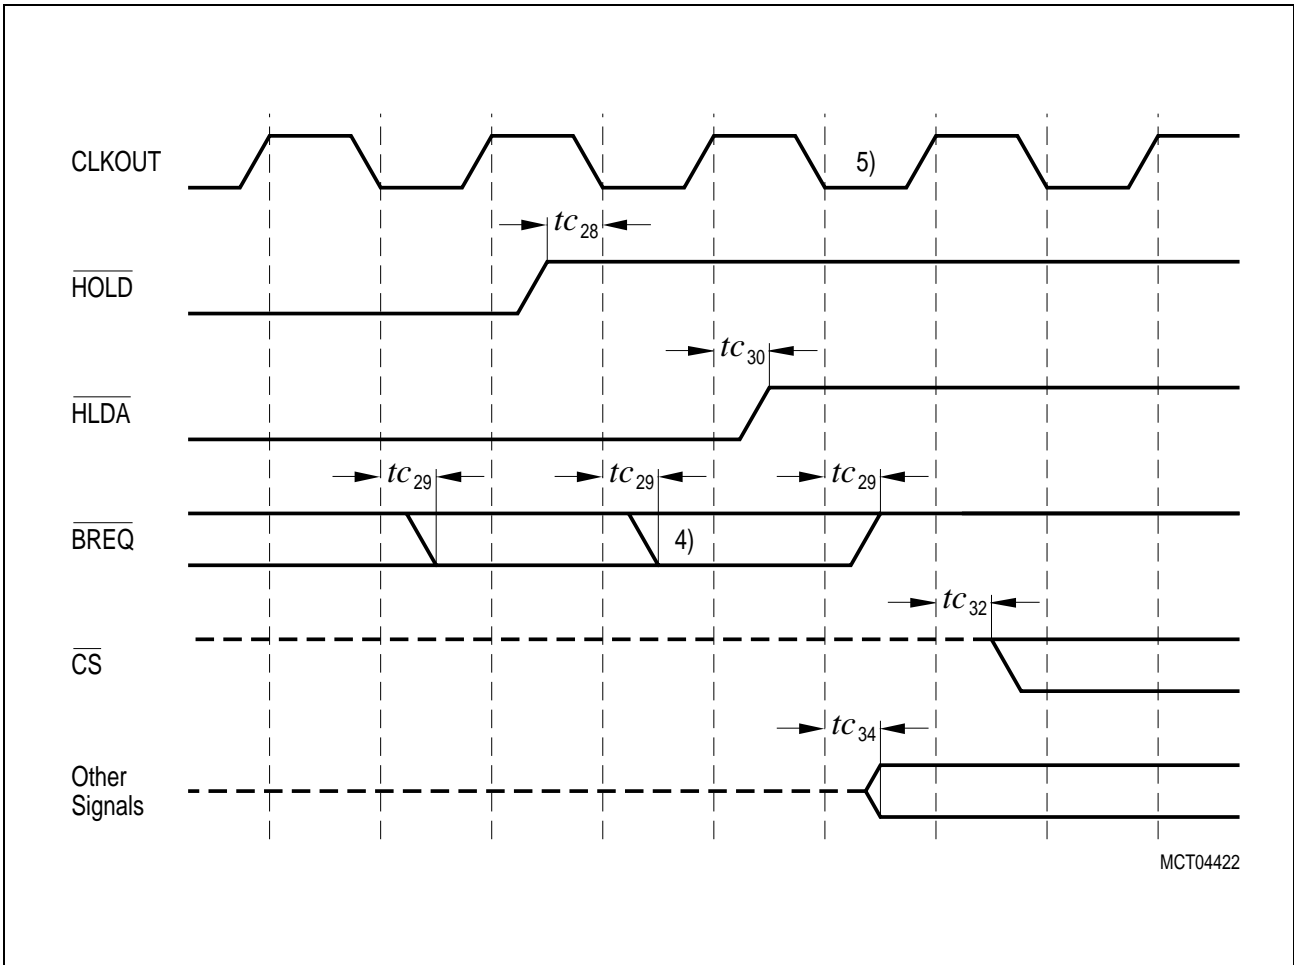

Figure 23 External Bus Arbitration, (Regaining the Bus)

Notes

- 4) This is the last chance for $\overline{\text{BREQ}}$ to trigger the indicated regain-sequence. Even if $\overline{\text{BREQ}}$ is activated earlier, the regain-sequence is initiated by $\overline{\text{HOLD}}$ going high. Please note that $\overline{\text{HOLD}}$ may also be deactivated without the C167CS requesting the bus.
- 5) The next C167CS driven bus cycle may start here.

External XRAM Access

If XPER-Share mode is enabled the on-chip XRAM of the C167CS can be accessed (during hold states) by an external master like an asynchronous SRAM.

Table 19 XRAM Access Timing (Operating Conditions apply)

Parameter	Symbol	Limits		Unit	
		min	max		
Address setup time before $\overline{RD}/\overline{WR}$ falling edge	t_{40} SR	4	–	ns	
Address hold time after $\overline{RD}/\overline{WR}$ rising edge	t_{41} SR	0	–	ns	
Data turn on delay after \overline{RD} falling edge	Read t_{42} CC	1	–	ns	
Data output valid delay after address latched		t_{43} CC	–	40	ns
Data turn off delay after \overline{RD} rising edge		t_{44} CC	1	14	ns
Write data setup time before \overline{WR} rising edge	Write t_{45} SR	10	–	ns	
Write data hold time after \overline{WR} rising edge		t_{46} SR	2	–	ns
\overline{WR} pulse width		t_{47} SR	20	–	ns
\overline{WR} signal recovery time		t_{48} SR	t_{40}	–	ns

Infineon goes for Business Excellence

“Business excellence means intelligent approaches and clearly defined processes, which are both constantly under review and ultimately lead to good operating results.

Better operating results and business excellence mean less idleness and wastefulness for all of us, more professional success, more accurate information, a better overview and, thereby, less frustration and more satisfaction.”

Dr. Ulrich Schumacher
