

TOSHIBA**TMP47C834**

CMOS 4-BIT MICROCONTROLLER

**TMP47C834N
TMP47C834F**

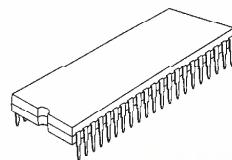

The 47C834 are based on the TLCS-470 CMOS series. The 47C834 have on-screen display circuit to display characters and marks which indicate channel or time on TV screen, A/D converter (comparator) input, and D/A converter output such as TV.

| PART No. | ROM | RAM | PACKAGE | OTP |
|------------|--------------|-------------|-------------------|------------|
| TMP47C834N | 8192 × 8-bit | 512 × 4-bit | SDIP42-P-600-1.78 | TMP47P834N |
| TMP47C834F | | | QFP44-1414-0.80D | TMP47P834F |

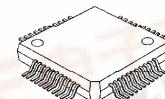

FEATURES

- ◆ 4-bit single chip microcomputer
- ◆ Instruction execution time : 1.9 μ s (at 4.2 MHz)
- ◆ 92 basic instructions
- ◆ Table look-up instructions
- ◆ Subroutine nesting : 15 levels max.
- ◆ 6 interrupt sources (External : 2, Internal : 4)
 - All sources have independent latches each, and multiple interrupt control is available
- ◆ I/O port (30 pins)
 - Input 2 ports 5 pins
 - I/O 7ports 25 pins
- ◆ Interval Timer
- ◆ Two 12-bit Timer / Counters
 - Timer, event counter, and pulse width measurement mode
- ◆ Watchdog timer
- ◆ Serial Interface with 8-bit buffer
 - Simultaneous transmission and reception capability
 - External / internal clock, leading / trailing edge shift, 4/8-bit
- ◆ On-screen display circuit
 - Character patterns : 62 characters
 - Characters displayed : 16 columns × 2 lines
 - Composition : 8 × 8 dots (smoothing function)
 - Size of character : 2 kinds (line by line)
 - Color of character : 7 kinds (character by character)
 - Variable display position : horizontal 64 / vertical 64 steps
 - Double scan mode switching function
- ◆ D/A converter (Pulse width modulation) outputs
 - 14-bit resolution 1 channel
 - 6-bit resolution 4 channels
- ◆ 3-bit A/D converter (Comparator) input
 - Auto frequency control signal (S-shaped curve) detection
- ◆ Pulse output (clock for PLL IC)
- ◆ Horizontal synchronous signal is detected by timer/counter
- ◆ Remote control signal preprocessing capability
- ◆ High current outputs
 - LED direct drive capability (typ. 20 mA × 4 bits)
- ◆ HOLD function : Battery / Capacitor back-up
- ◆ Real Time Emulator : BM47C834B

PIN FUNCTION

| PIN NAME | Input/Output | FUNCTIONS | |
|--|-----------------|--|--|
| K03 to K00 | input | 4-bit input port | |
| R43 (PWM3) to R41 (PWM1) R40 (PWM0) | I/O (output) | 4-bit I/O port with latch. When used as input port or D/A converter outputs pins, the latch must be set to "1". | 6-bit D/A converter (PWM) output 14-bit D/A converter (PWM) output |
| R53 to R51 | I/O | | |
| R50 (PWM4) | I/O (output) | | 6-bit D/A converter (PWM) output |
| R63 to R60 | I/O | 4-bit I/O port with latch. When used as input port, the latch must be set to "1". | |
| R73 (PULSE) | I/O (output) | 4-bit I/O port with latch. | PULSE output |
| R72 | I/O | When used as input port, watchdog timer output pin, or A/D converter input pin, the latch must be set to "1". | |
| R71 (WTO) | I/O (output) | | Watchdog timer output |
| R70 (CIN) | I/O (input) | | 3-bit A/D converter input |
| R83 (T1) | | | Timer / counter 1 external input |
| R82 (INT1) | | | External interrupt 1 input |
| R81 (T2) | | | Timer / counter 2 external input |
| R80 (INT2) | | | External interrupt 2 input |
| R92 (SCK) | I/O (I/O) | 3-bit I/O port with latch. | Serial clock I/O |
| R91 (SO) | I/O (output) | When used as input port or serial port, the latch must be set to "1". | Serial data output |
| R90 (SI) | I/O (input) | | Serial data input |
| G (RA1) | | | 2-bit I/O port with latch. |
| R (RA0) | Output (I/O) | RGB output | When used as input port, the latch must be set to "1". |
| B | Output | | |
| Y (BL) | Output (output) | Focus signal output | Background blanking control signal output |
| HD, VD | Input | Horizontal synchronous signal input, Vertical synchronous signal input | |
| OSC1, OSC2 | input, output | Resonator connecting pin of on-screen display circuit | |
| XIN, XOUT | input, output | Resonator connecting pin. For inputting external clock, XIN is used and XOUT is opened. | |
| RESET | input | Reset signal input | |
| HOLD (KE0) | input (input) | HOLD request/release signal input | Sense input |
| TEST | input | Test pin for out-going test. Be opened or fixed to low level. | |
| VDD | Power supply | + 5 V | |
| VSS | | 0 V (GND) | |

OPERATIONAL DESCRIPTION

Concerning the 47C834 the configuration and functions of hardware are described.

As the description has been provided with priority on those parts differing from the 47C834, the technical data sheets for the 47C834 shall all so be referred to.

1. SYSTEM CONFIGURATION

◆ INTERNAL CPU FUNCTION

They are the same as those of the 47C860 except system clock controller.

◆ PERIPHERAL HARDWARE FUNCTION

- ① Input / Output Ports
- ② Interval Timer
- ③ Timer / Counters (TC1, TC2)
- ④ Watchdot Timer
- ⑤ Remote Control pulse detector
- ⑥ On-screen display (OSD) control circuit
- ⑦ A/D converter (comparator) input
- ⑧ D/A converter (Pulse Width Modulation) output
- ⑨ Pulse output circuit

The description has been provide with priority on functions (①, ⑥, ⑦, ⑧ and ⑨) added to and changed from 47C860.

2. INTERNAL CPU FUNCTION

2.1 Operation clock control

On the 47C834 only single clock mode is available. As single clock mode is automatically selected at the initialization, there is no necessary to set system clock control command register (OP16).

After reset, 47C834 is placed in the single-clock mode.

Only the normal 1 operating mode can be active.

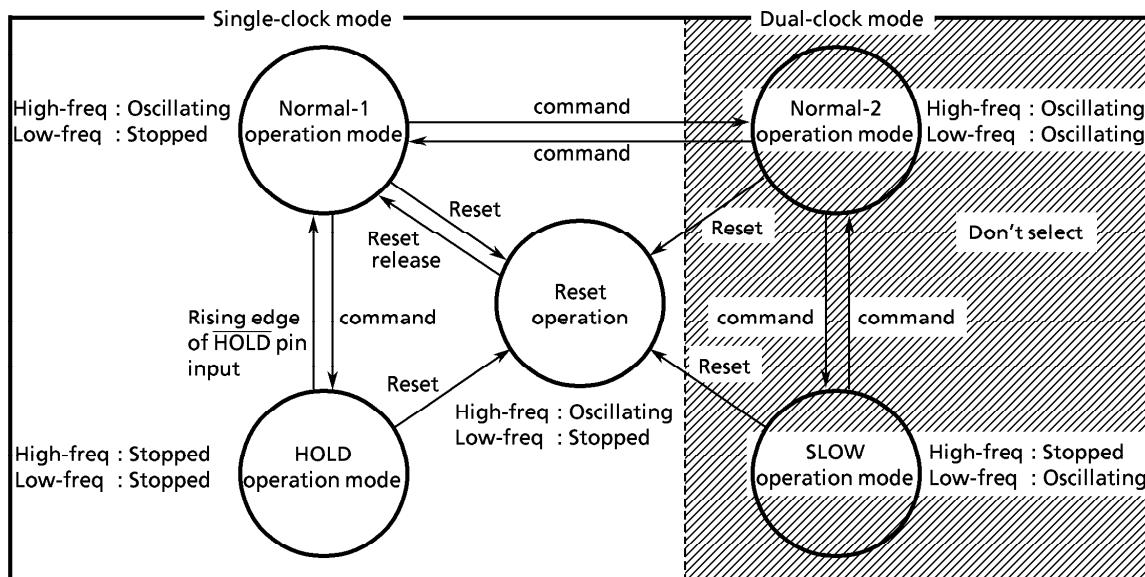

Figure 2-1. Operation Mode Transition Diagram

3. PERIPHERAL HARDWARE FUNCTION

3.1 I/O ports

The 47C834 have 9 I/O ports (30 pins) each as follows.

- ① K0 ; 4-bit input
- ② R4, R5 ; 4-bit input / output (shared with pulse width modulation output)
- ③ R6 ; 4-bit input / output
- ④ R7 ; 4-bit input / output (shared with comparator input and watchdog timer output)
- ⑤ R8 ; 4-bit input / output (shared with external interrupt input and timer/counter input)
- ⑥ R9 ; 3-bit input / output (shared with serial port)
- ⑦ RA ; 2-bit input / output (shared with on-screen display output)
- ⑧ KE ; 1-bit sense input (shared with hold request / release signal input)

The description has been provide with priority on functions (② and ④) added to and changed from 47C860, and it describes port of ⑦, which item of on-screen display circuit.

(1) Port R4 (R43 to R40)

This is a 4-bit I/O port with latch. It is a port common to D/A converter(PWM) output port. R4 port output buffers are Tri-state, and each bit of them can be controled independently by the program. Controling the Tri-state is performed by the command register accessed as port address OP00. When some bit of the OP00 is 0, the corresponding bit of the output buffers becomes high impedance state. The output latch should be set to "1" when the port is used as $\overline{\text{PWM}}$ output port, the $\overline{\text{PWM}}$ output should be to "H" level(PWM data is all "0")when the port is used as R 4 port. The output buffers should be set to high impedance state,when the port is used as input port. And the R4 output latch be set to "1", $\overline{\text{PWM}}$ output be set to "High" level, and the output buffer be set to High-Inpedance state during reset.

R4 (Port Address OP04/IP04)

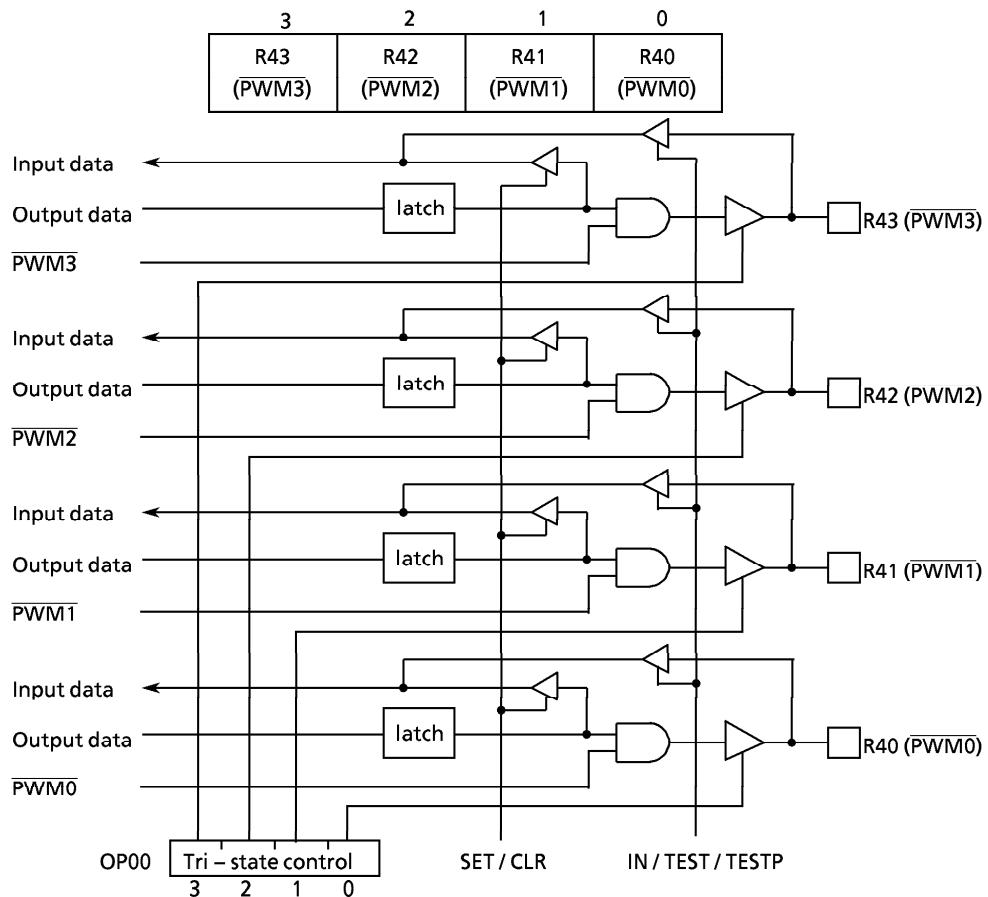

Figure 3-1. Port R4 ($\overline{\text{PWM}}$)

(2) Port R5 (R53 to R50)

The 4-bit I/O port with latch. The only R50 pin share D/A converter (PWM) output. The port output buffers are tri-state, and each bit of them can be controlled independently by the program. Controlling the tri-state is performed by the command register accessed as port address OP13.

```
Example : LD A,#1111B ; OP13←1111B
          OUT A,%OP13
          OUT #05H,%OP05 ; R5 port←5H
```

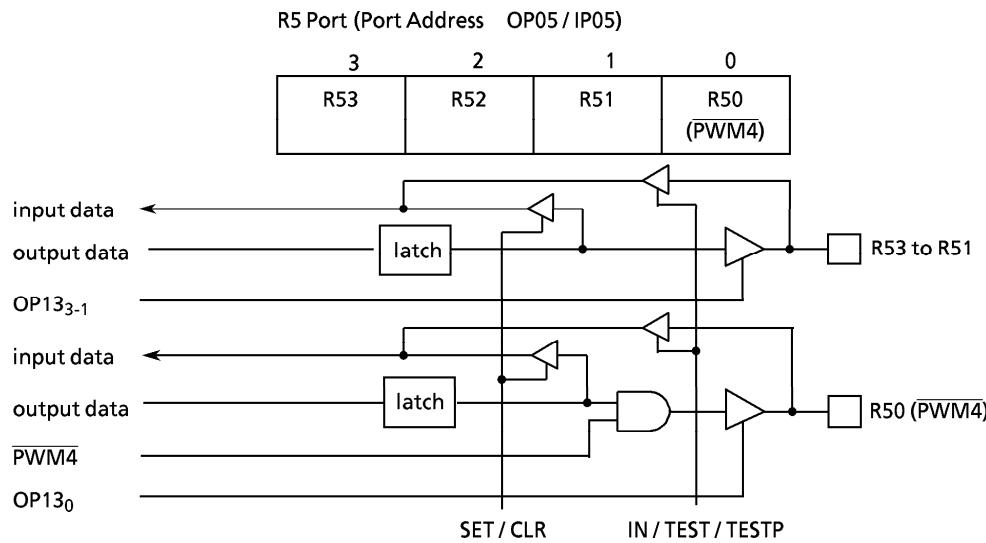

Figure 3-2. Port R5

(3) Port R7 (R73 to R70)

The 4-bit I/O port with latch. When used as an input port, the latch should be set to "1". The latch is initialized to "1" during reset. R72 pins is I/O port usually.

Pin R70 (CIN) is shared with the digital input usual and the A/D converter (comparator) input for Auto Frequency Control signal detection. CIN input is comparator input and setting of 3-bit DIA convert for reference voltage are performed by the command register. R71 (WTO), R73 (PULSE) pins are shared with the watchdog timer output and pulse output. R70, R71, R73 pins latch is initialized to "1" during reset, and they are able to use I/O port usually.

Note 2: The status input of serial interface, clock generator, and HOLD (KE0) pin.

Table 3-1. Port Address Assignments and Available I/O Instructions

3.2 On-screen display (OSD) circuit

An on-screen display (OSD) circuit used to display characters and symbols in built into the TV screen. A maximum of 32 characters, as 16 columns × 2 lines, out of 62 character patterns can be displayed at a time.

3.2.1 OSD Circuit Function

- | | |
|---------------------------------------|---|
| ① Number of characters | 62 kinds |
| ② Number of characters displayed | 32 characters (16 columns × 2 lines) |
| ③ Composition of a character | 8 × 8 dots (with smoothing function) |
| ④ Size of character | 2 kinds (selectable line by line) |
| ⑤ Color of character | 7 kinds (selectable character by character) |
| ⑥ Display position variable | horizontal 64 steps, vertical 64 steps |
| ⑦ Double Scan mode switching function | |

3.2.2 OSD Circuit Configuration

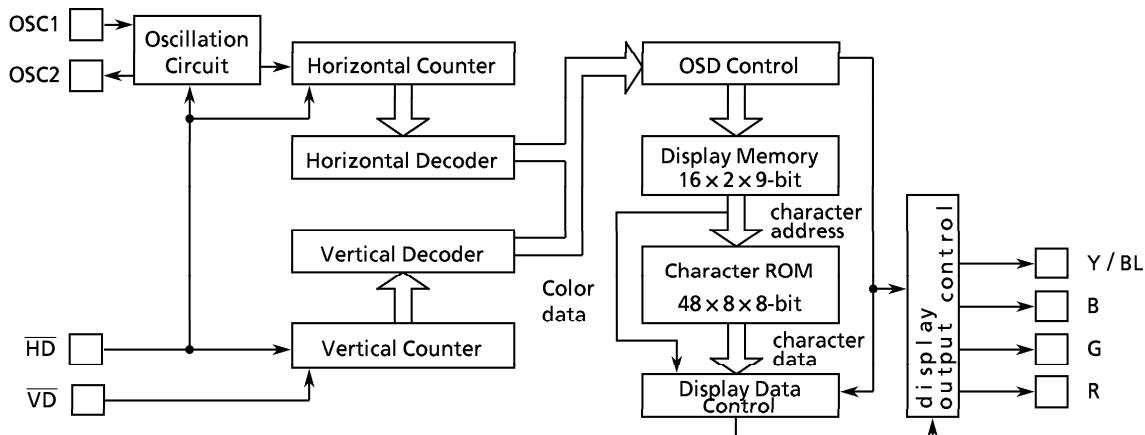

Figure 3-4. OSD Circuit

3.2.3 OSD Circuit Control

The OSD circuit is controlled by the command selector (OP0C) and control register (OP1A). Table 3-2 shows the relationship between OP0C and OP1A. OP1A is multiplexed with the six output control registers which control the display start position, color of character and character size of character, and the two transfer control registers which transfer character data to the display memory.

The output control registers consist of 8 bits and all bits can be written by accessing OP1A two times. However, the second access is not required unless the second data are changed. The addressed "0 to 5" are assigned to the six output control registers. OP1A can be accessed by writing the address of the control register where data are to be changed to OP0C. The transfer control registers can be accessed by writing "6" or "7" to OP0C. The transfer control registers have a 12-bit configuration and can access OP1A three times succession. The first access sets which column is displayed within one line 16 columns. The second and third accesses written 6 bit of character data.

The display memory has a 16-columns × 9-bit × 2 lines configuration with a one-to-one correspondence to the number of columns displayed on the screen. The display data consist of 6 character data bits and 3 color data bits for a total of 9 bits. When "6" is written to OP0C, line 1 is stored to the display memory, when "7" is written to OP0C, line 2 is stored. That is after accessing OP0C, the character data specified the second and third times are written to the display memory area specified in the first OP1A access together with the color data loaded to control register DCR50. Thus color can be specified for each character. After setting of all control registers is completed, the character data read from the character ROM(00 to 2F_H)are output to the R, G and B pins together with the color data by setting OP0C to "F".

Note : The writing a data from display memory is prior than the reading. Therefore, if a data is written to the display memory until the display line is displaying, the display is incorrect.

A data must be written to display memory when the display is off or when one and two display line are not displayed.

Table 3-2. OSD control commands and control registers

3.2.4 Configuration of display character

(1) Composition of character and smoothing function

Each character is composed by 8×8 dots. Each dot corresponds to a bit in the character ROM.

Figure 3-5. (a) shows an example Composition of a character.

Smoothing function is the function to make characters look smooth. In the time the smoothing function is enabled, additional dots are displayed in the middle of the place where two dots contact each other only at a corner. Controlling of the smoothing function is performed by ESMZ in the OSD control register DCR41. Figure 3-5. (b) shows an example of the smoothing function.

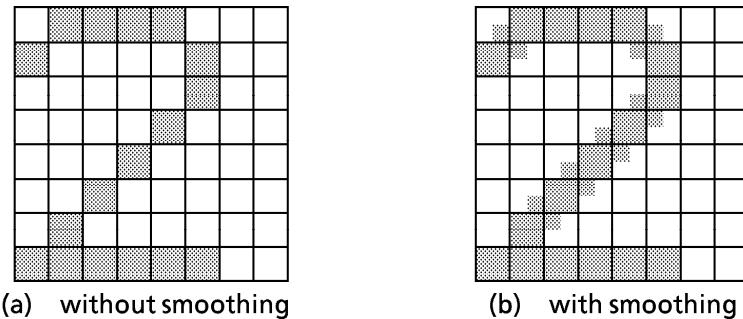

Figure 3-5. Composition of character and smoothing function

(2) Character size and color to display

Size of the characters displayed on screen is selectable line by line from 2 sizes. The size of the first and second display line is designated by CS11 to CS10 and CS21 to CS20 in the OSD control register DCR40, respectively.

Table 3-3 shows the setting values and character sizes of DCR40.

Table 3-4 shows the display character sizes.

One out of seven colors can be selected for each character to be displayed and are determined by RDT, GDT, and BDT of DCR50. The color data are written to the display memory automatically at the same time as character data are written

| Character size (DCR40) | second display line | | first display line | |
|---------------------------|------------------------|------|-----------------------|------|
| | CS21 | CS20 | CS11 | CS10 |
| small character | 1 | 0 | 1 | 0 |
| large character | 0 | 1 | 0 | 1 |
| display OFF | 0 | 0 | 0 | 0 |

Table 3-3. Designation of character size

| | small character | large character |
|----------------|-----------------------------|-----------------------------|
| dot size | $2T_{HD} \times 2T_{OSC}$ | $4T_{HD} \times 4T_{OSC}$ |
| character size | $16T_{HD} \times 16T_{OSC}$ | $32T_{HD} \times 32T_{OSC}$ |

Note. T_{HD} :the period of horizontal synchronous signal
 T_{OSC} :the period of OSD clock oscillation

Table 3-4. character size.

| colors displayed on screen | color data(DCR50) | | |
|----------------------------------|-------------------|-----|-----|
| | RDT | GDT | BDT |
| Blank | 0 | 0 | 0 |
| Blue | 0 | 0 | 1 |
| Green | 0 | 1 | 0 |
| Sian | 0 | 1 | 1 |
| Red | 1 | 0 | 0 |
| Mazenda | 1 | 0 | 1 |
| Yellow | 1 | 1 | 0 |
| White | 1 | 1 | 1 |

Note. Color to display : RGB pin uses Red, Green, Blue such as.

Table 3-5. select of color to display

3.2.5 Display start position

Display start position of each display line on screen can be shifted by software.

The vertical and horizontal display starting position for the first line is determined by HS10 to 15 and VS10 to 15 of DCR00 to 11.

The vertical and horizontal display starting position for the second line is determined by HS20 to 25 and VS20 to 25 of DCR20 to 31. Each has a resolution of 64 steps.

The control register and display line on screen are shown in Table 3-6.

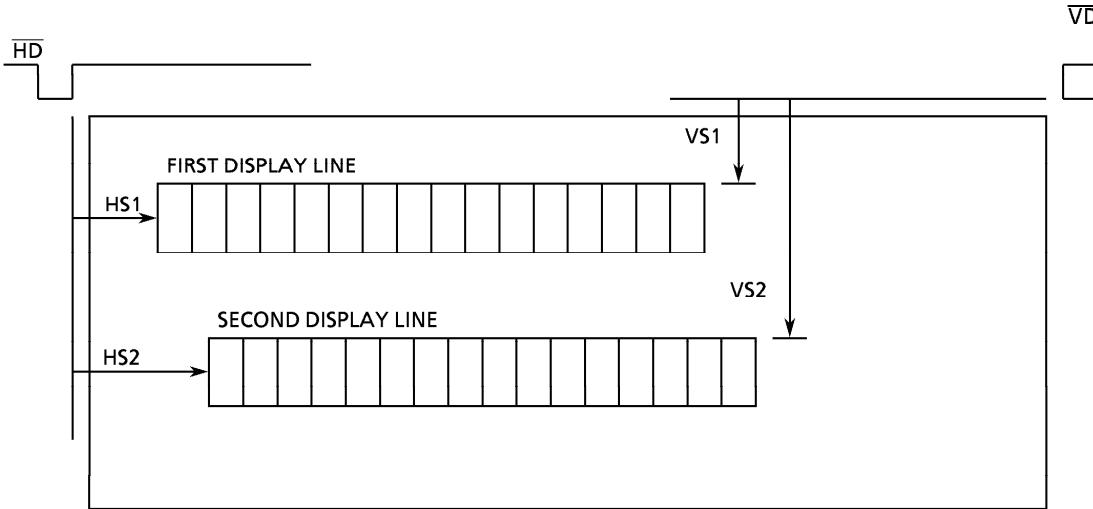

Figure 3-6. TV screen image

| SYMBOL | CONTENTS |
|--------------|---|
| HS10 to HS15 | horizontal start position of the first display line $HS1 = ((32 \times HS15 + 16 \times HS14 + 8 \times HS13 + 4 \times HS12 + 2 \times HS11 + HS10) \times 4 + X) T_{osc}$ |
| VS10 to VS15 | vertical start position of the first display line $VS1 = (32 \times VS15 + 16 \times VS14 + 8 \times VS13 + 4 \times VS12 + 2 \times VS11 + VS10) \times 4 T_{HD}$ |
| HS20 to HS25 | horizontal start position of the second display line $HS2 = ((32 \times HS25 + 16 \times HS24 + 8 \times HS23 + 4 \times HS22 + 2 \times HS21 + HS20) \times 4 + X) T_{osc}$ |
| VS20 to VS25 | vertical start position of the second display line $VS2 = (32 \times VS25 + 16 \times VS24 + 8 \times VS23 + 4 \times VS22 + 2 \times VS21 + VS20) \times 4 T_{HD}$ |

Note. X : X is 17 when small character.
X is 34 when large character.

Table 3-6. Display start position

- * The vertical display positions of lines 1 and 2 can be specified independently but, to prevent overlapping of the two lines on the display, the value for the vertical display position of line 2 must satisfy ($VS2 > VS1 + CS11 \times 16 T_{HD} + CS10 \times 32 T_{HD}$) .

3.2.4 Y/BL signal

The Y signal (the logical or output of the R, G and B signals) makes the display clearer by deleting the background only where characters are displayed. The BL signal deletes the entire background for one character (8 × 8 dots) and is output for all data except that at address 2F_H in the character ROM.

The Y/BL pin is used for both Y signal and BL signal output. Which of the two signals is to be output is determined by the upper 2 bits of OP0A. The dotted lines in Figure 3-7 show the Y/BL signal output being scanned.

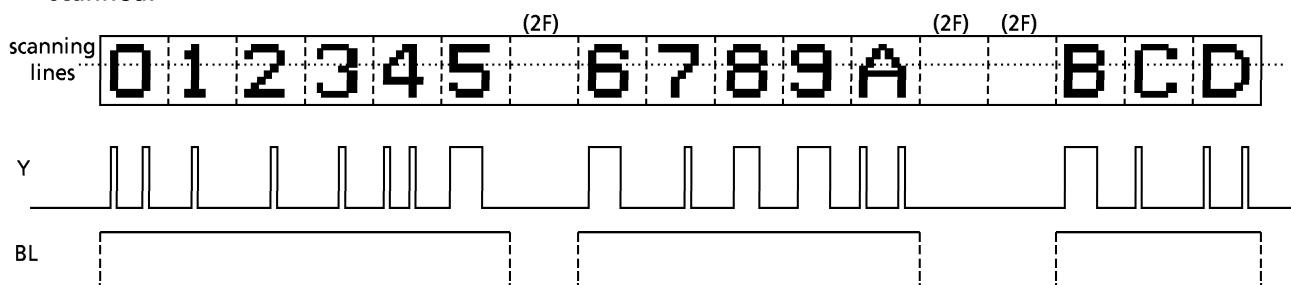

Figure 3-7. Example of Y and BL signal output

3.2.5 Control of OSD outputs buffer

The OSD outputs for Y,BL and RGB use tri-state output buffers for which the respective polarities can be inverted. Polarity is controlled by DRC41 and tri-state is controlled by DRC51.
Bit 3 of DRC41 is used for controlling the smoothing function.

| register | bit | symbol | output name | data "0" | data "1" |
|----------|-----|--------|-------------|-------------------|------------------|
| DRC41 | 3 | ESMZ | — | smoozing OFF | smoozing ON |
| | 2 | BLIV | BL | active High | active Low |
| | 1 | YIV | Y | active High | active Low |
| | 0 | RGBIV | RGB | active High | active Low |
| DRC51 | 3 | EBF3 | Y / BL | output buffer OFF | output buffer ON |
| | 2 | EBF2 | B | output buffer OFF | output buffer ON |
| | 1 | EBF1 | G | output buffer OFF | output buffer ON |
| | 0 | EBF0 | R | output buffer OFF | output buffer ON |

Table 3-7. Control of OSD output

3.2.6 RA Port Function

R signal output and G signal output ports are also used as I/O ports. When not used for color signals,use is possible as normal I/O ports. RA port and Y/BL selection is performed by OP0A.
Also, the upper 2 bits of IP0A are used to input the OSD display status.

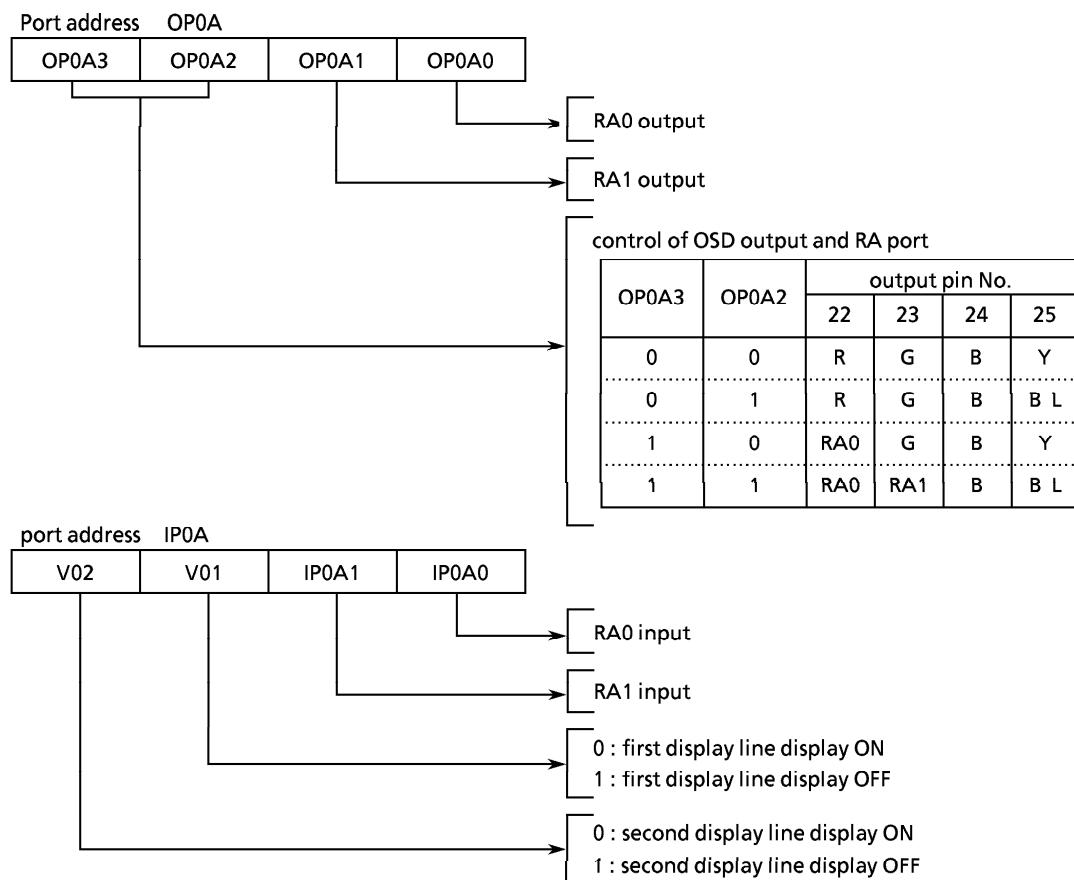

Figure 3-8. Port RA

3.2.7 Character ROM

The 47C834 can display 62 different 8×8 dot characters (character ROM addresses $00_H - 3D_H$). Address $2F_H$ in the character ROM displays a blank, as with the 47C434/634, so set all ROM data to "0".

The first 48 characters of the 47C834 character ROM are the same as those of the 47C434A/634A; therefore, 47C434A/634A programs can be used without change.

Figure 3-9. Character ROM Configuration

Note : Addresses $3EH$ and $3FH$ the character ROM are used in out going test.

Data can be not specified by users.

3.2.8 Double Scan Mode Switching Function

The 47C834 has an Double scan mode switching function for selecting the interlace mode or the double scan (non-interlace) mode.

When the double scan mode is used, the number of scan lines on the screen is double that of the interlace mode; therefore, the \overline{HD} signal is single-stage divided so that the vertical display start position and character size will be the same as with the interlace mode.

In the double scan mode, the horizontal scan line cycle is one-half that of the interlace mode; therefore, it is necessary to increase the OSD oscillation frequency.

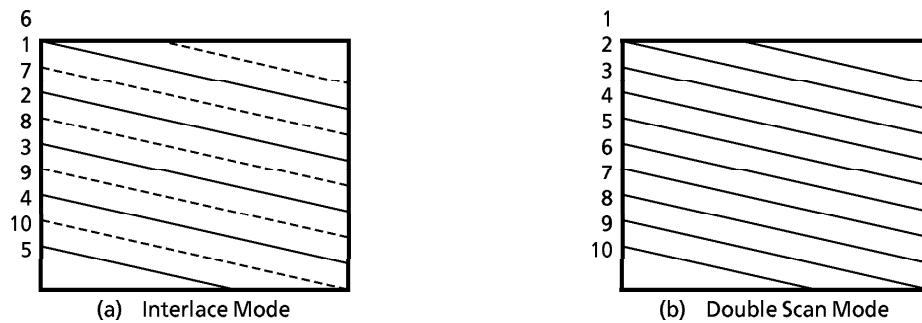

Figure 3-10. Double Scan Mode

3.2.9 Double Scan Mode Control

Double scan mode switching is controlled by WHD of the command register OP0B. Setting WHD to "0" selects the double scan mode and setting WHD to "1" selects the interlace mode. The initial setting selects the interlace mode.

Double Scan Mode Control
(Port address : OP0B Initial value : 11*1)

| 3 | 2 | 1 | 0 |
|----------------------|-------|---|--------------------|
| | | * | WHD |
| WHD | | | Double Scan mode |
| 0 : Double scan mode | | | 1 : Interlace mode |

Figure 3-11. Double Scan Mode Command Register

3.3 3-bit A/D converter (Comparator) input

Comparator input consists of a comparator and a 3-bit D/A convertor. AFC input voltage can be detected in 8 steps by sensing bit 0 of IP07 while changing the reference voltage (D/A convertor output voltage) with the command register (OP12).

R70 pin is also used for comparator input. Bit 3 is used to set R70 pin for ordinary digital input.

The comparator is disabled and bit 3 is set to "0" during reset. The latch should be set to "1" when R70 pin is used for comparator input and digital input.

3.3.1 Circuit Configuration

The comparator input circuit shown in Fig 3.12.

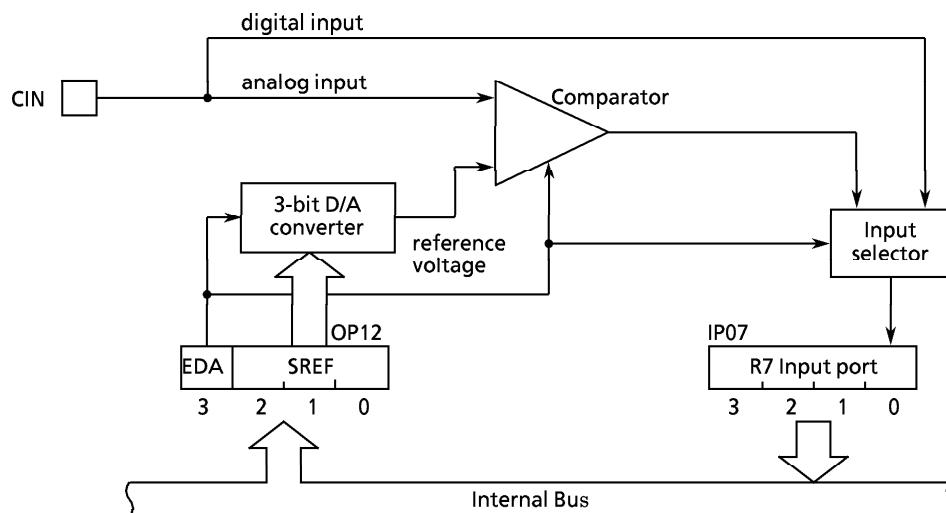

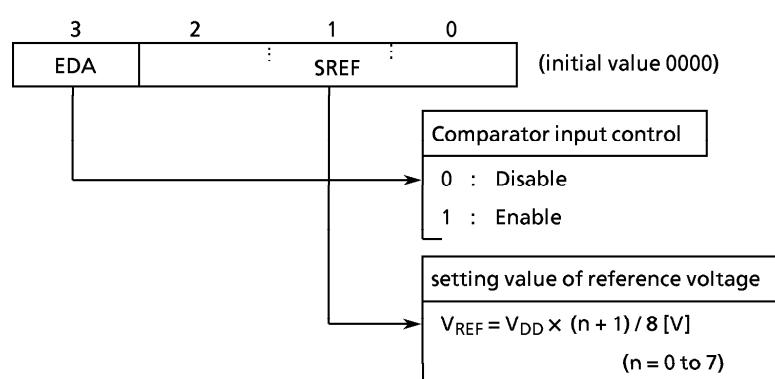

Figure 3-12. Comparator input circuit

3.3.2 Control of Comparator Input

The reference voltage of the comparator is set using the lower 3 bits of the command register. Table 3-8 shows the reference voltage when $V_{DD} = 5 \text{ V}$.

Comparator input control command register (Port address OP12)

| OP12 | reference voltage [V] |
|-------|-----------------------|
| 2 1 0 | |
| 0 0 0 | 0.62 |
| 0 0 1 | 1.25 |
| 0 1 0 | 1.87 |
| 0 1 1 | 2.50 |
| 1 0 0 | 3.12 |
| 1 0 1 | 3.75 |
| 1 1 0 | 4.37 |
| 1 1 1 | 5.00 |

Table 3-8. Reference Voltage

3.4 D / A converter (PWM) output

The 47C434A/634A have five channels built-in D/A converter (Pulse width Modulation) outputs. PWM output can easily be obtained by connecting an external low pass filter.

PWM outputs data are multiplexed to the R4 port and R50 pin. When the R4 (PWM) port and R50 pin are used for PWM output, the corresponding bits of R4, R50 output latch should be set to "1". The R4, R5 output latch is initialized to "1" during reset.

PWM output is controlled by the buffer selector (OP17) and the data transfer buffer (OP18). PWM data written to the data transfer buffer can be sent to the PWM data latch by writing "CH" to the buffer selector, and PWM output PWM output. PWM data transferred to the PWM data latch remain intact until overwritten. Resetting and holding clear the buffer selector, data transfer buffer and PWM data latch to "0" (PWM output is "H" level).

3.4.1 Configuration of Pulse Width Modulation circuit

Configuration of pulse width modulation circuit shown in Figure 3-15.

3.4.2 Output waveform of PWM circuit

(1) PWM0 output

PWM0 is a PWM output controlled by 14 bits data. The basic period of the PWM0 is $T_M = 2^{15}/f_c$.

The higher 8 bits of 14 bits data are used to control the pulse width of the pulse output with the period of $T_S = T_M/64$, which is the sub - period of the PWM0. When the 8 bits data are decimal n ($0 \leq n \leq 255$), this pulse width becomes $n \times t_0$, where $t_0 = 2/f_c$.

The lower 6 bits of 14 bits data are used to control the generation of an additional t_0 wide pulse in each T_S period. When the 6 bits data are decimal m ($0 \leq m \leq 63$), the additional pulse is generated in each of m periods out of 64 periods contained in a T_M period. The relationship between the 6 bits data and the position of T_S period where the additional pulse is generated is shown in Table 3-9. (The additional pulse is not generated on $T_S(0)$).

(2) PWM1-PWM4 output

Each of PWM1 to PWM4 is a PWM output controlled by 6 bits data. The period of them is $T_M = 2^7/f_c$.

When the 6 bits data are decimal k ($0 < k < 63$), the pulse width becomes $k \times t_0$. The waveform is also illustrated in Figure 3-14.

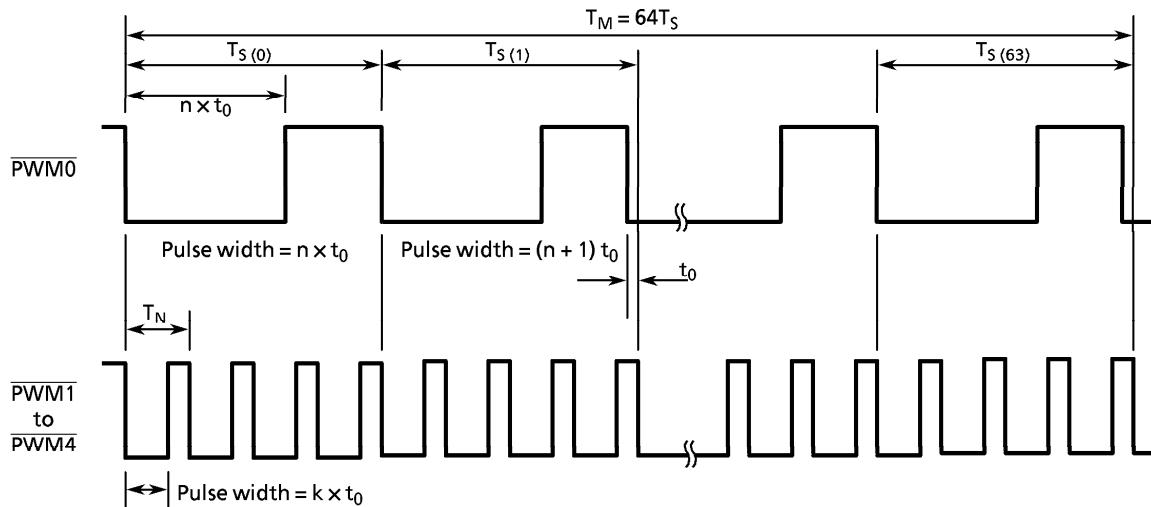

Figure 3-14. PWM Output Waveform (It is shown to the additional pulse $T_S(1)$ and $T_S(63)$ of the PWM0)

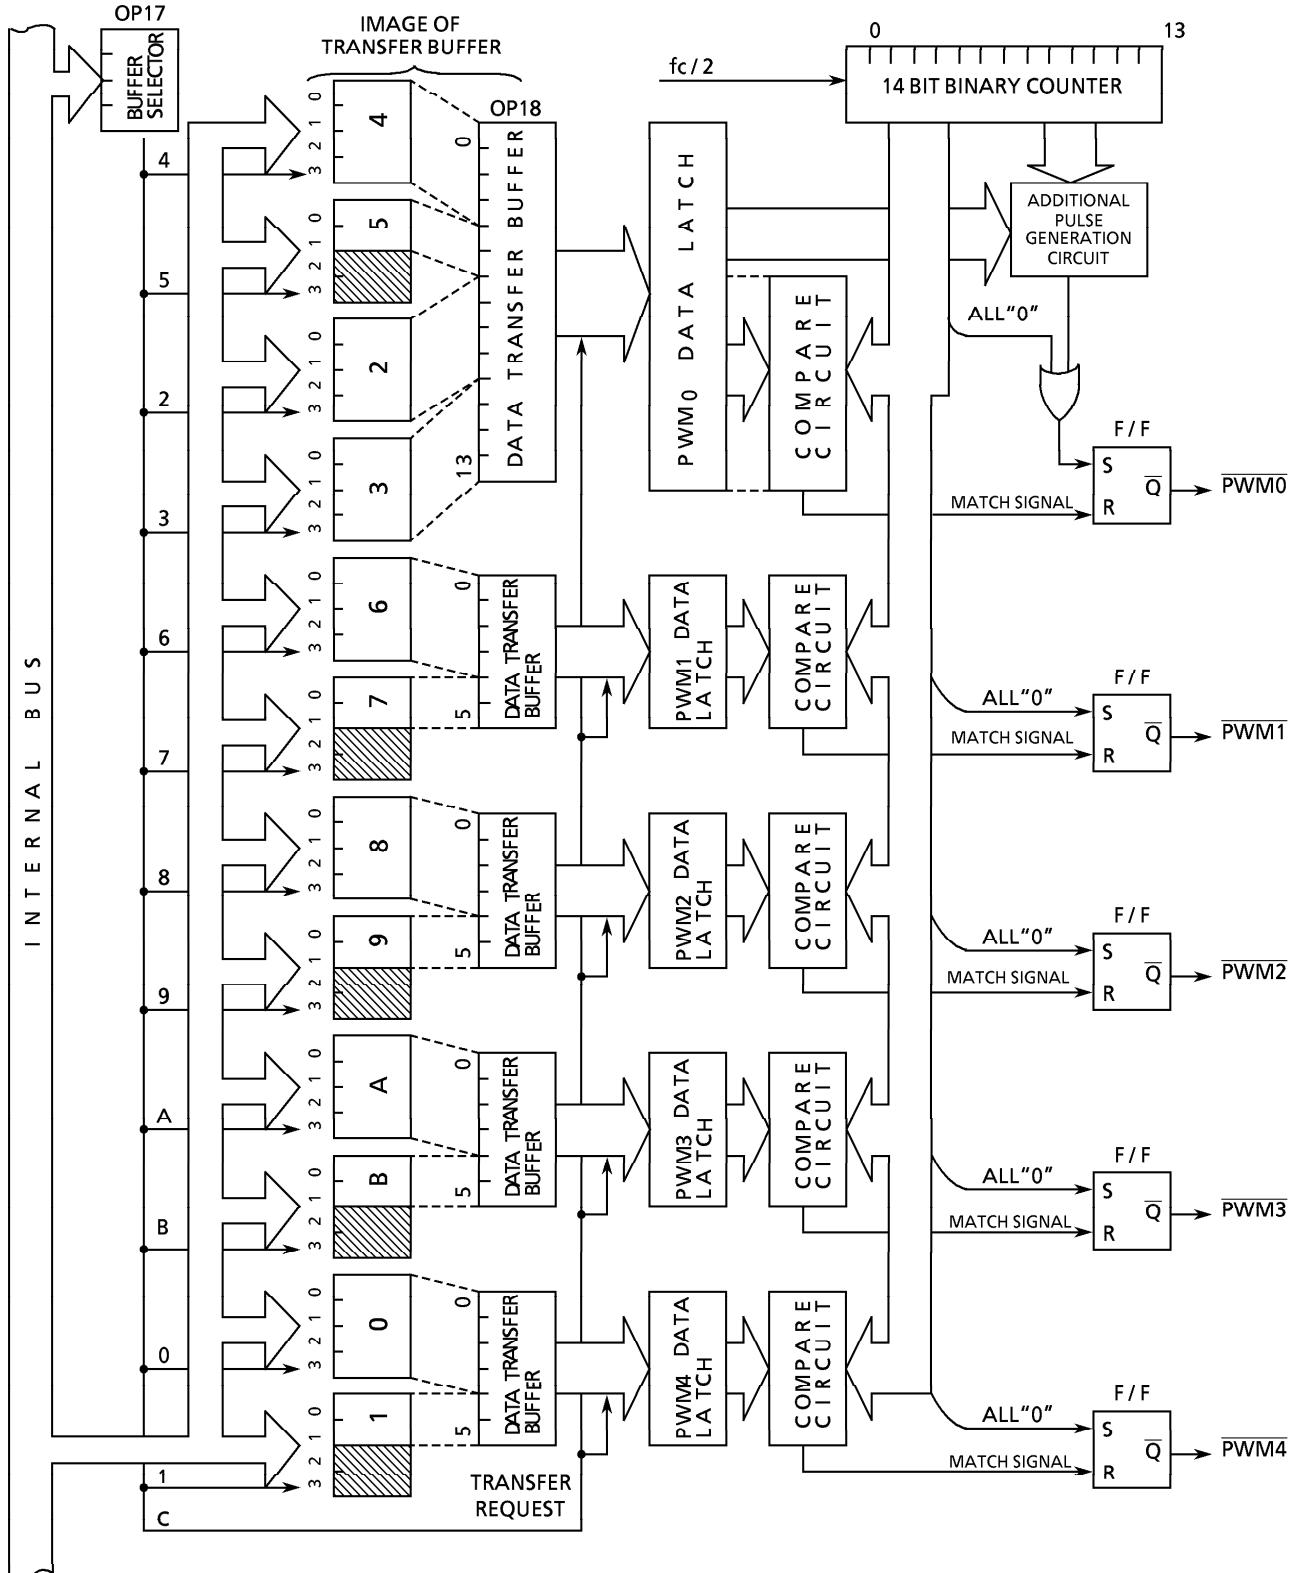

Figure 3-15. Pulse Width Modulation Circuit

| Bit position of 6 vits data | Relative position of T_S where the output pulse is generated (No. i of $T_{S(i)}$ is listed) |
|-----------------------------|---|
| bit0 | 32 |
| bit1 | 16, 48 |
| bit2 | 8, 24, 40, 56 |
| bit3 | 4, 12, 20, 28, 36, 44, 52, 60 |
| bit4 | 2, 6, 10, 14, 18, 22, 26, 30, ..., 58, 62 |
| bit5 | 1, 3, 5, 7, 9, 11, 13, 15, 17, ..., 59, 61, 63 |

Note . When the corresponding bit is "1", it is output.

Table 3-9. Correspondence between 6 bits data and the additional pulse generated T_S periods

3.4.3 Control of PWM circuit (Data transfer)

PWM output is controlled by writing output data to a data transfer buffer (OP18). For writing, the output data are divided using the buffer selector (OP17). Buffer numbers are assigned to the data transfer buffers for these divided data, after which the data are written as shown in Table 3-10.

- ① The number of the transfer buffer to which the data are to be written is written to the buffer selector (OP17).
- ② The corresponding PWM data are written to the selected buffer (OP18).
- ③ Operations ① and ② are repeated, continuously writing data to the transfer buffer.
- ④ When all of the output data have been written. " C_H " is written to the buffer selector.

While the output data are being written to the transfer buffer, the previously written data are being output. For $\overline{PWM0}$ output, switching to \overline{PWM} output occurs at a maximum of $2^{15}/fc$ [s] (at 4 MHz, 8192fs) after " C_H " is written to the buffer selector. For $PWM1$ through $PWM4$ output data switching, this requires $2^9/fc$ [s] (at 4 MHz, 128 μ s).

| Buffer Number (OP17) | Correspondence to bit (OP18) | Mode | PWM Output |
|-------------------------|---------------------------------|----------|----------------|
| 0 | Bit of PWM4 transfer buffer | 3 to 0 | Preceding data |
| 1 | Bit of PWM4 transfer buffer | 5 to 4 | Preceding data |
| 2 | Bit of PWM0 transfer buffer | 9 to 6 | Preceding data |
| 3 | Bit of PWM0 transfer buffer | 13 to 10 | Preceding data |
| 4 | Bit of PWM0 transfer buffer | 3 to 0 | Preceding data |
| 5 | Bit of PWM0 transfer buffer | 5 to 4 | Preceding data |
| 6 | Bit of PWM1 transfer buffer | 3 to 0 | Preceding data |
| 7 | Bit of PWM1 transfer buffer | 5 to 4 | Preceding data |
| 8 | Bit of PWM2 transfer buffer | 3 to 0 | Preceding data |
| 9 | Bit of PWM2 transfer buffer | 5 to 4 | Preceding data |
| A | Bit of PWM3 transfer buffer | 3 to 0 | Preceding data |
| B | Bit of PWM3 transfer buffer | 5 to 4 | Preceding data |
| C | None | Transfer | Present data |

Table 3-10. The bit and Buffer number of data transfer Buffer

3.5 Pulse Output Circuit

Pulse output circuit generates the pulse clock by dividing the clock frequency to R73 port. The pulse output is used for the basic clock for the PLL IC or peripheral ICs. The pulse output frequency can be set by accessing command register (OP0B). Command register is initialized to "11**" during reset. When R73 port is used as the pulse output, set R73 output latch to "1".

Notice of ROM code release for masked products

When releasing ROM code for mask products, please take notice as follows,

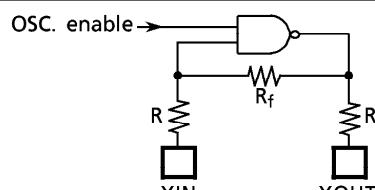

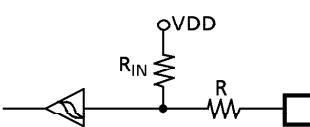

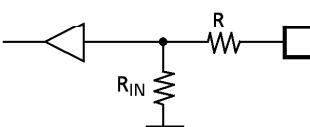

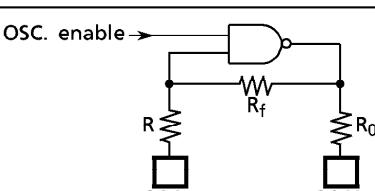

- (1) The area of program and program / fixed data
 - Fill the data "FF_H" at all addresses of unused area.
- (2) The area of character data
 - Load the character data at the address 2000_H to 21EF_H.
 - Fill the data "FF_H" at all addresses of unused characters.

INPUT / OUTPUT CIRCUITRY

(1) Control Pins

Input / output circuitries of the 47C834 control pins are shown below.

| CONTROL PIN | I/O | CIRCUITRY | REMARKS |
|--------------|------------------|---|---|
| XIN XOUT | Input Output |  | Resonator connecting pins $R = 1 \text{ k}\Omega$ (typ.) $R_f = 1.5 \text{ M}\Omega$ (typ.) $R_O = 2 \text{ k}\Omega$ (typ.) |
| RESET | Input |  | Hysteresis input Contained pull-up resistor $R_{IN} = 220 \text{ k}\Omega$ (typ.) $R = 1 \text{ k}\Omega$ (typ.) |
| HOLD (KE0) | Input (Input) |  | Hysteresis input (Sense input) $R = 1 \text{ k}\Omega$ (typ.) |
| TEST | Input |  | Contained pull-down resistor $R_{IN} = 70 \text{ k}\Omega$ (typ.) $R = 1 \text{ k}\Omega$ (typ.) |
| OSC1 OSC2 | Input Output |  | Oscillation terminals for OSD $R = 1 \text{ k}\Omega$ (typ.) $R_f = 1.5 \text{ M}\Omega$ (typ.) $R_O = 2 \text{ k}\Omega$ (typ.) |
| HD VD | Input |  | Synchronous signal input Hysteresis input $R = 1 \text{ k}\Omega$ (typ.) |

(2) I/O Ports

The input/output circuitries of the 47C834 I/O ports are shown below, any one of the circuitries (PB, PC, PF, PU) can be chosen by a code as a mask option.

| PART | I/O | INPUT/OUTPUT CIRCUITRY and CODE | | REMARKS |
|--------------------|--------|---------------------------------|------------|---|
| K0 | Input | PB | PC, PF, PU | Pull-up or pull-down resistor $R_{IN} = 70\text{ k}\Omega$ (typ.) $R = 1\text{ k}\Omega$ (typ.) |
| | | | | |
| R4 R50 | I/O | PB, PC | PF, PU | Tri-state or Sink open drain Initial "Hi-Z" $R = 1\text{ k}\Omega$ (typ.) |
| | | | | |
| R51 R52 R53 | I/O | | | Tri-state Initial "Hi-Z" $R = 1\text{ k}\Omega$ (typ.) |
| | | | | |
| R7 | I/O | | | Sink open drain Initial "Hi-Z" Hysteresis input (R8, R9) $R = 1\text{ k}\Omega$ (typ.) |
| | | | | |
| R (RA0) G (RA1) | I/O | PB, PC, PF | PU | Sink open drain and push-pull Comparator input (R70 pin) $R = 1\text{ k}\Omega$ (typ.) |
| | | | | |
| B Y (BL) | Output | | | Tri-state Initial "Hi-Z" $R = 1\text{ k}\Omega$ (typ.) R, G : Side a B, Y : Side b |

ELECTRICAL CHARACTERISTICS
