

## **0.5MHz, Low Supply Voltage, Low Input Current BiMOS Operational Amplifiers**

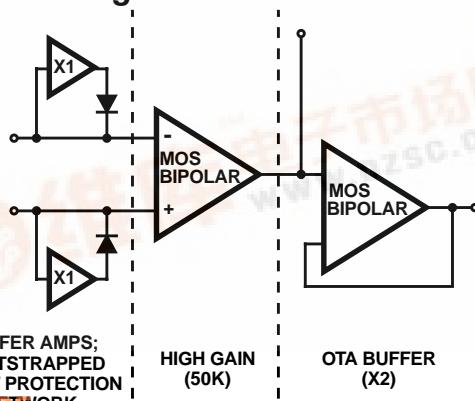

The CA5420A is an integrated circuit operational amplifier that combines PMOS transistors and bipolar transistors on a single monolithic chip. It is designed and guaranteed to operate in microprocessor logic systems that use V<sub>+</sub> = 5V, V<sub>-</sub> = GND, since it can operate down to  $\pm 1\text{V}$  supplies. It will also be suitable for 3.3V logic systems.

The CA5420A BiMOS operational amplifier features gate-protected PMOS transistors in the input circuit to provide very high input impedance, very low input currents (less than 1pA). The internal bootstrapping network features a unique guardbanding technique for reducing the doubling of leakage current for every  $10^{\circ}\text{C}$  increase in temperature. The CA5420A operates at total supply voltages from 2V to 20V either single or dual supply. This operational amplifier is internally phase compensated to achieve stable operation in the unity gain follower configuration. Additionally, it has access terminals for a supplementary external capacitor if additional frequency roll-off is desired. Terminals are also provided for use in applications requiring input offset voltage nulling. The use of PMOS in the input stage results in common-mode input voltage capability down to 0.45V below the negative supply terminal, an important attribute for single supply application. The output stage uses a feedback OTA type amplifier that can swing essentially from rail-to-rail. The output driving current of 1.0mA (Min) is provided by using nonlinear current mirrors.

This device has guaranteed specifications for 5V operation over the full military temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

The CA5420A has the same 8 lead pinout used for the industry standard 741.

## **Functional Diagram**

## **Features**

- CA5420A at 5V Supply Voltage with Full Military Temperature Range Guaranteed Specifications
- CA5420A Guaranteed to Operate from  $\pm 1\text{V}$  to  $\pm 10\text{V}$  Supplies
- 2V Supply at 300 $\mu\text{A}$  Supply Current
- 1pA (Typ) Input Current (Essentially Constant to  $85^{\circ}\text{C}$ )
- Rail-to-Rail Output Swing (Drive  $\pm 2\text{mA}$  Into  $1\text{k}\Omega$  Load)
- Pin Compatible with 741 Op Amp

## **Applications**

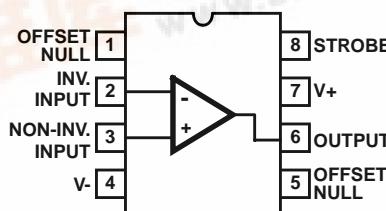

- pH Probe Amplifiers
- Picoammeters
- Electrometer (High Z) Instruments
- Portable Equipment
- Inaccessible Field Equipment
- Battery Dependent Equipment (Medical and Military)
- 5V Logic Systems
- Microprocessor Interface

## **Ordering Information**

PART NUMBER (BRAND)	TEMP. RANGE ( $^{\circ}\text{C}$ )	PACKAGE	PKG. NO.
CA5420AM (5420A)	-55 to 125	8 Ld SOIC	M8.15

## Absolute Maximum Ratings

Supply Voltage (Between V+ and V- Terminals) . . . . .	22V
Differential Input Voltage . . . . .	15V
Input Voltage . . . . .	(V+ + 8V) to (V- - 0.5V)
Input Current . . . . .	1mA
Output Short Circuit Duration (Note 1). . . . .	Indefinite

## Thermal Information

Thermal Resistance (Typical, Note 2)	$\theta_{JA}$ ( $^{\circ}\text{C}/\text{W}$ )	$\theta_{JC}$ ( $^{\circ}\text{C}/\text{W}$ )
SOIC Package . . . . .	157	N/A
Maximum Junction Temperature (Plastic Package) . . . . .	150 $^{\circ}\text{C}$	
Maximum Storage Temperature Range (All Types) . . . . .	-65 $^{\circ}\text{C}$ to 150 $^{\circ}\text{C}$	
Maximum Lead Temperature (Soldering 10s) . . . . .	300 $^{\circ}\text{C}$	
(SOIC - Lead Tips Only)		

## Operating Conditions

Temperature Range . . . . . -55 $^{\circ}\text{C}$  to 125 $^{\circ}\text{C}$

*CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.*

### NOTES:

1. Short circuit may be applied to ground or to either supply.
2.  $\theta_{JA}$  is measured with the component mounted on an evaluation PC board in free air.

## Electrical Specifications Typical Values Intended Only for Design Guidance. V+ = +5V; V- = GND, $T_A = 25^{\circ}\text{C}$

PARAMETER		SYMBOL	TEST CONDITIONS		CA5420A	UNITS	
Input Resistance		$R_I$			150	$\text{T}\Omega$

NOTE:

- The maximum limit represents the levels obtainable on high-speed automatic test equipment. Typical values are obtained under laboratory conditions.

# CA5420A

## Typical Applications

### Picoammeter Circuit

The exceptionally low input current (typically 0.2pA) makes the CA5420A highly suited for use in a picoammeter circuit. With only a single 10GΩ resistor, this circuit covers the range from  $\pm 1.5\text{pA}$ . Higher current ranges are possible with suitable switching techniques and current scaling resistors. Input transient protection is provided by the 1MΩ resistor in series with the input. Higher current ranges require that this resistor be reduced. The 10MΩ resistor connected to pin 2 of the CA5420A decouples the potentially high input capacitance often associated with lower current circuits and reduces the tendency for the circuit to oscillate under these conditions.

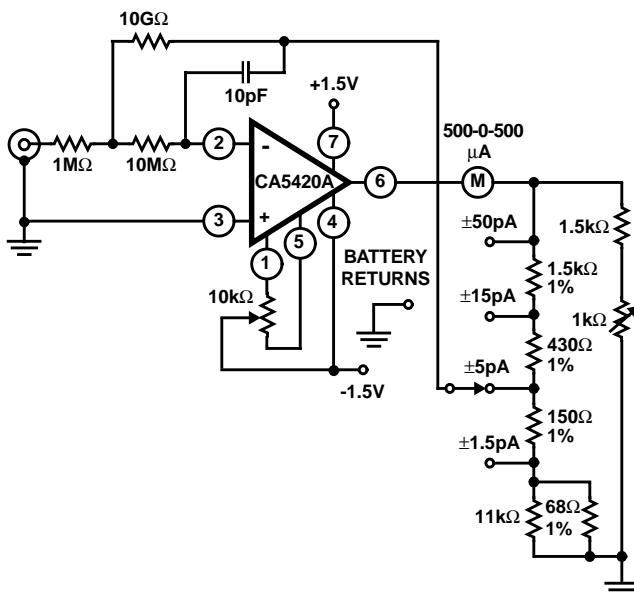

FIGURE 1. PICOAMMETER CIRCUIT

### High Input Resistance Voltmeter

Advantage is taken of the high input impedance of the CA5420A in a high input resistance DC voltmeter. Only two 1.5V "AA" type penlite batteries power this exceedingly high-input resistance ( $>1,000,000\text{M}\Omega$ ) DC voltmeter. Full-scale deflection is  $\pm 500\text{mV}$ ,  $\pm 150\text{mV}$ , and  $\pm 15\text{mV}$ . Higher voltage ranges are easily added with external input voltage attenuator networks.

The meter is placed in series with the gain network, thus eliminating the meter temperature coefficient error term.

Supply current in the standby position with the meter undeflected is  $300\mu\text{A}$ . At full-scale deflection this current rises to  $800\mu\text{A}$ . Carbon-zinc battery life should be in excess of 1,000 hours.
