

## 8-PIN CURRENT MODE PUSH-PULL PWM CONTROLLERS WITH PROGRAMMABLE SLOPE COMPENSATION

### FEATURES

- Programmable Slope Compensation
- Internal Soft-Start on the UCC38083/4
- Cycle-by-Cycle Current Limiting
- Low Start-Up Current of 120  $\mu$ A and 1.5 mA Typical Run Current
- Single External Component Oscillator Programmable from 50 kHz to 1 MHz
- High-Current Totem-Pole Dual Output Stage Drives Push-Pull Configuration with 1-A Sink and 0.5-A Source Capability
- Current Sense Discharge Transistor to Improve Dynamic Response
- Internally Trimmed Bandgap Reference
- Undervoltage Lockout with Hysteresis

### BASIC APPLICATION

UDG-01080

### APPLICATIONS

- High-Efficiency Switch-Mode Power Supplies
- Telecom dc-to-dc Converters
- Point-of-Load or Point-of-Use Power Modules
- Low-Cost Push-Pull and Half-Bridge Applications

### DESCRIPTION

The UCC38083/4/5/6 is a family of BiCMOS pulse width modulation (PWM) controllers for dc-to-dc or off-line fixed-frequency current-mode switching power supplies. The dual output stages are configured for the push-pull topology. Both outputs switch at half the oscillator frequency using a toggle flip-flop. The dead time between the two outputs is typically 110 ns, limiting each output's duty cycle to less than 50%.

The new UCC3808x family is based on the UCC3808A architecture. The major differences include the addition of a programmable slope compensation ramp to the CS signal and the removal of the error amplifier. The current flowing out of the ISET pin through an external resistor is monitored internally to set the magnitude of the slope compensation function. This device also includes an internal discharge transistor from the CS pin to ground, which is activated at each clock cycle after the pulse is terminated. This discharges any filter capacitance on the CS pin during each cycle and helps minimize filter capacitor values and current sense delay.

The UCC38083 and the UCC38084 devices have a typical soft-start interval time of 3.5 ms while the UCC38085 and the UCC38086 has less than 100  $\mu$ s for applications where internal soft-start is not desired.

The UCC38083 and the UCC38085 devices have the turn-on/off thresholds of 12.5 V / 8.3 V, while the UCC38084 and the UCC38086 has the turn-on/off thresholds of 4.3 V / 4.1 V. Each device is offered in 8-pin TSSOP (PW), 8-pin SOIC (D) and 8-pin PDIP (P) packages.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## ORDERING INFORMATION

**THERMAL RESISTANCE TABLE**

PACKAGE	$\theta_{jc} (^{\circ}\text{C}/\text{W})$	$\theta_{ja} (^{\circ}\text{C}/\text{W})$
SOIC-8 (D)	42	84 to 160 <sup>(1)</sup>
PDIP-8 (P)	50	110 <sup>(1)</sup>
TSSOP-8 (PW)	32 <sup>(2)</sup>	232 to 257 <sup>(2)</sup>

- NOTES: (1) Specified  $\theta_{ja}$  (junction to ambient) is for devices mounted to 5-inch<sup>2</sup> FR4 PC board with one ounce copper where noted. When resistance range is given, lower values are for 5 inch<sup>2</sup> aluminum PC board. Test PWB was 0.062 inch thick and typically used 0.635-mm trace widths for power packages and 1.3-mm trace widths for non-power packages with a 100-mil x 100-mil probe land area at the end of each trace.
- (2). Modeled data. If value range given for  $\theta_{ja}$ , lower value is for 3x3 inch. 1 oz internal copper ground plane, higher value is for 1x1-inch. ground plane. All model data assumes only one trace for each non-fused lead.

**AVAILABLE OPTIONS**

T <sub>A</sub>	INTERNAL SOFT START	UVLO		PACKAGES		
		ON	OFF	SOIC-8 (D)	PDIP-8 (P)	TSSOP-8 (PW)

## absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Supply voltage, $V_{DD}$ ( $I_{DD} < 10$ mA)	15 V
Supply current, $I_{DD}$	20 mA
Sink current (peak):	
OUTA	1.0 A
OUTB	1.0 A
Source current (peak):	
OUTA	-0.5 A
OUTB	-0.5 A
Analog inputs:	
CTRL	-0.3 V to $V_{DD} + 0.3$ V
CS	-0.3 V to $V_{DD} + 0.3$ V, not to exceed 6 V
$R_{SET}$ (minimum)	>5 k $\Omega$
$R_T$ ( $-100 \mu\text{A} < I_{RT} < 100 \mu\text{A}$ )	-0.3 V to 2.0 V
Power dissipation at $T_A = 25^\circ\text{C}$ (P package)	1 W
Power dissipation at $T_A = 25^\circ\text{C}$ (D package)	650 mW
Power dissipation at $T_A = 25^\circ\text{C}$ (PW package)	400 mW
Junction operating temperature, $T_J$	-55°C to 150°C
Storage temperature, $T_{stg}$	-65°C to 150°C
Lead temperature (soldering 10 seconds)	300°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltages are with respect to GND. Currents are positive into, and negative out of the specified terminal.

## electrical characteristics over recommended operating virtual junction temperature range, $V_{DD} = 10$ V (See Note 1), 1- $\mu\text{F}$ capacitor from VDD to GND, $R_T = 165$ k $\Omega$ , $R_F = 1$ k $\Omega$ , $C_F = 220$ pF, $R_{SET} = 50$ k $\Omega$ , $T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$ for UCC2808x, $T_A = 0^\circ\text{C}$ to $70^\circ\text{C}$ for UCC3808x, $T_A = T_J$ (unless otherwise noted)

SLUS488B – SEPTEMBER 2002 – REVISED MAY 2003

## detailed pin descriptions

**CTRL:** The error voltage is typically generated by a secondary-side error amplifier and transmitted to the primary-side referenced UCC3808x by means of an opto-coupler. CTRL has an internal divider ratio of 0.45 to maintain a usable range with the minimum  $V_{DD}$  of 4.1 V. The UCC38083/UCC38084 family features a built-in full-cycle soft start while the UCC38085/6 does not.

For the UCC38083/4, soft-start is implemented as a clamp at the input to the PWM comparator. This causes the output pulses to start near 0% duty cycle and increase until the clamp exceeds the CTRL voltage.

**ISET:** Program the slope compensation current ramp by connecting a resistor, RSET, from ISET to ground. The voltage of the ISET pin tracks the 1.5-V internal oscillator ramp, as shown in Figure 1.

Figure 1. Full Duty Cycle Output

The compensating current source,  $I_{SLOPE}$ , at the CS pin is proportional to the ISET current, according to the relation:

$$I_{SLOPE} = 5 \times I_{SET} \quad (1)$$

The ramping current due to  $I_{SLOPE}$  develops a voltage across the effective filter impedance that is normally connected from the current sense resistor to the CS input. In order to program a desired compensating slope with a specific peak compensating ramp voltage at the CS pin, use the RSET value in the following equation:

$$RSET = V_{OSC(peak)} \times \left( \frac{5 \times RF}{RAMP \text{ VOLTAGE HEIGHT}} \right) \quad (2)$$

$$\text{Where } V_{OSC(peak)} = 1.5 \text{ V}$$

Notice that the PWM Latch drives an internal MOSFET that will discharge an external filtering capacitor on the CS pin. Thus,  $I_{SLOPE}$  will appear to terminate when the PWM comparator or the cycle-by-cycle current limit comparator sets the PWM latch. The actual compensating slope is not affected by premature termination of the switching cycle.

**detailed pin descriptions (continued)**

**OUTA and OUTB:** Alternating high-current output stages. Both stages are capable of driving the gate of a power MOSFET. Each stage is capable of 500-mA peak-source current, and 1-A peak-sink current.

The output stages switch at half the oscillator frequency, in a push-pull configuration. When the voltage on the internal oscillator capacitor is rising, one of the two outputs is high, but during fall time, both outputs are off. This dead time between the two outputs, along with a slower output rise time than fall time, ensures that the two outputs cannot be on at the same time. This dead time is typically 110 ns.

The high-current output drivers consist of MOSFET output devices, which switch from VDD to GND. Each output stage also provides a very low impedance to overshoot and undershoot. This means that in many cases, external Schottky clamp diodes are not required.

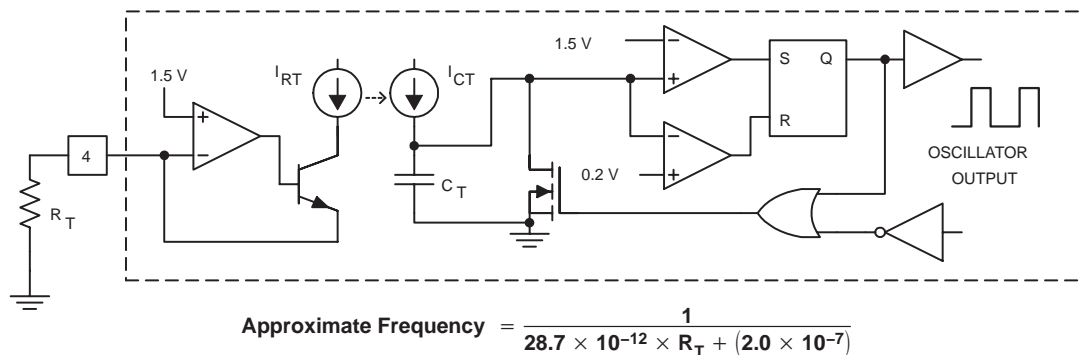

**RT:** The oscillator programming pin. The oscillator features an internal timing capacitor. An external resistor,  $R_T$ , sets a current from the RT pin to ground. Due to variations in the internal  $C_T$ , nominal  $V_{RT}$  of 1.5 V can vary from 1.2 V to 1.6 V

Selecting  $R_T$  as shown programs the oscillator frequency:

$$R_T = \frac{1}{28.7 \times 10^{-12}} \left( \frac{1}{f_{OSC}} - 2.0 \times 10^{-7} \right) \tag{3}$$

where  $f_{OSC}$  is in Hz, resistance in  $\Omega$ . The recommended range of timing resistors is between 25 k $\Omega$  and 698 k $\Omega$ .

For best performance, keep the timing resistor lead from the RT pin to GND (pin 5) as short as possible.

UDG-01083

**Figure 2. Block Diagram for Oscillator**

**VDD:** The power input connection for this device. Although quiescent VDD current is very low, total supply current may be higher, depending on OUTA and OUTB current, and the programmed oscillator frequency. Total VDD current is the sum of quiescent VDD current and the average OUT current. Knowing the operating frequency and the MOSFET gate charge ( $Q_G$ ), average OUT current can be calculated from:

$$I_{OUT} = Q_G \times f_{OSC} \tag{4}$$

where  $f$  is the oscillator frequency.

To prevent noise problems, bypass VDD to GND with a ceramic capacitor as close to the chip as possible along with an electrolytic capacitor. A 1- $\mu$ F decoupling capacitor is recommended.

## APPLICATION INFORMATION

The following application circuit shows an isolated 12- $V_{IN}$  to 2.5  $V_{OUT}$  push-pull converter with scalable output power (20 W to 200 W). Note that the pinout shown is for SOIC-8 and PDIP-8 packages.

### typical application

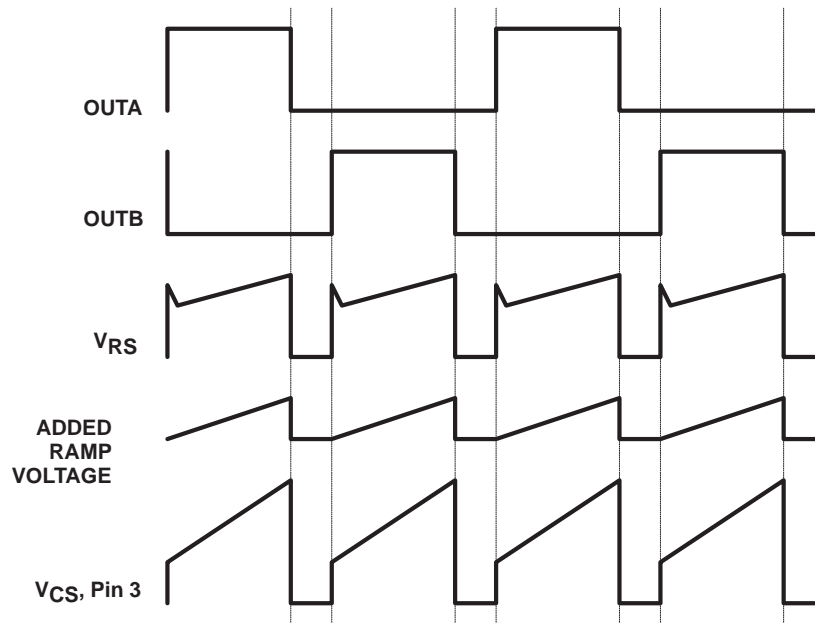

UDG-01084

## APPLICATION INFORMATION

### operational waveforms

Figure 3 illustrates how the voltage ramp is effectively added to the voltage across the current sense element  $V_{CS}$ , to implement slope compensation.

UDG-01085

**Figure 3. Typical Slope Compensation Waveforms at 80% Duty Cycle**

In Figure 3, OUTA and OUTB are shown at a duty cycle of 80%, with the associated voltage  $V_{RS}$  across the current sense resistor of the primary push-pull power MOSFETs. The current flowing out of CS generates the ramp voltage across the filter resistor  $R_F$  that is positioned between the power current sense resistor and the CS pin. This voltage is effectively added to  $V_{RS}$  to provide slope compensation at  $V_{CS}$ , pin 3. A capacitor  $C_F$  is also recommended to filter the waveform at CS.

SLUS488B – SEPTEMBER 2002 – REVISED MAY 2003

## layout considerations

To prevent noise problems, bypass VDD to GND with a ceramic capacitor as close to the chip as possible along with an electrolytic capacitor. A 1- $\mu$ F decoupling capacitor is recommended.

Use a local ground plane near the small signal pins (CTRL, ISET, CS and RT) of the IC for shielding. Connect the local ground plane to the GND pin with a single trace. Do not extend the local ground plane under the power pins (VDD, OUTA, OUTB and GND). Instead, use signal return traces to the GND pin for ground returns on the side of the integrated circuit with the power pins.

For best performance, keep the timing resistor lead from RT pin (pin 4) to GND (pin 5) as short as possible.

## special layout considerations for the TSSOP package

Due to the different pinout and smaller lead pitch of the TSSOP package, special attention must be paid to minimize noise problems. The pinout is different because the device had to be rotated 90° to fit into the smaller TSSOP package.

For example, the two output pins are now on opposite sides of the package. The traces should not run under the package together as they will couple switching noise into analog pins.

Another common problem is when RT and OUTB (pins 6 and 8) are routed together for some distance even though they are not immediate side by side pins. Because of this, when OUTB rises, a voltage spike of upto 400 mV can couple into the RT. This spike causes the internal charge current into CT to be turned off momentarily resulting in lower duty cycle. It is also important that note that the RT pin voltage cannot be stabilized with a capacitor. The RT pin is just a dc voltage to program the internal CT. Instead, keep the OUTB and RT runs short and far from each other and follow the printed wiring board layout suggestions above to fix the problem.

## reference design

A reference design is discussed in *50-W Push-Pull Converter Reference Design Using the UCC38083*, TI Literature Number SLUU135. This design controls a push-pull synchronous rectified topology with input range of 18 V to 35 V (24 nominal) and 3.3-V output at 15 A. The schematic is shown in Figure 5 and the board layout for the reference design is shown in Figure 4. Refer to the document for further details.

To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
