description

The CDC303 contains eight flip-flops designed to have low skew between outputs. The eight outputs (six in-phase with CLK and two out-of-phase) toggle on successive CLK pulses. Preset ($\overline{PRE}$) and clear ($\overline{CLR}$) inputs are provided to set the Q and $\overline{Q}$ outputs high or low independent of the clock (CLK) input.

The CDC303 has output and pulse-skew parameters $t_{sk(o)}$ and $t_{sk(p)}$ to ensure performance as a clock driver when a divide-by-two function is required.

The CDC303 is characterized for operation from 0°C to 70°C.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage, V_{CC} . . . . . 7 V
Input voltage, V_I . . . . . 7 V
Maximum power dissipation at T_A = 55°C (in still air) (see Note 1): D package . . . . . 0.77 W
N package . . . . . 1.2 W
Storage temperature range, T_{stg} . . . . . –65°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 300 mils, except for the N package, which has a trace length of zero. For more information, refer to the *Package Thermal Considerations* application note in the 1994 *ABT Advanced BiCMOS Technology Data Book*, literature number SCBD002B.

PARAMETER MEASUREMENT INFORMATION

NOTES: A. $t_{sk(o)}$, CLK to Q, is calculated as the greater of:
- The difference between the fastest and slowest of t_{PLHn} (n = 1, 2, 3, 4, 5, 6)
- The difference between the fastest and slowest of t_{PHLn} (n = 1, 2, 3, 4, 5, 6)

B. $t_{sk(o)}$, CLK to $\overline{Q}$, is calculated as the greater of: $| t_{PLH7} - t_{PLH8} |$ and $| t_{PHL7} - t_{PHL8} |$.

C. $t_{sk(o)}$, CLK to Q and $\overline{Q}$, is calculated as the greater of:
- The difference between the fastest and slowest of t_{PLHn} (n = 1, 2, 3, 4, 5, 6), t_{PHL7}, and t_{PHL8}
