## 200-MHz CLOCK SYNTHESIZER/DRIVER WITH SPREAD SPECTRUM CAPABILITY AND DEVICE CONTROL INTERFACE

SCAS675 – APRIL 2002

- Generates Clocks for AMD-K8 Clawhammer Desktop Systems
- Uses a 14.318-MHz Crystal Input to Generate Multiple Output Frequencies
- Includes Spread Spectrum Clocking (SSC), 0.5% Downspread for Reduced EMI
- Power Management Control Terminals
- SMBus Serial Interface Provides Output Enable and Control
- Low-Output Skew and Low Jitter for Clock Distribution
- Operates From Single 3.3-V Supply
- Generates the Following Clocks:
  - 2 CPU (3.3 V, 180° shifted pairs, 200/166/133/100 MHz)
  - 6 PCI (3.3 V, 33 MHz)
  - 1 PCI\_F (3.3 V, 33 MHz)
  - 3 REF (3.3 V, 14.318 MHz)
  - 1 USB (3.3 V, 48 MHz)
  - 1 FDC (3.3 V, 24 MHz or 48 MHz)
  - 3 PCI/LDT† (3.3 V, 33 MHz or 66 MHz)
- Packaged in 48-Pin SSOP Package

### description

The CDC960 is a clock synthesizer/driver and buffer that generates CPU, PCI, PCI/LDT, USB, FDC, and REF system clock signals to support PCs with an AMD-K8 Clawhammer-class system.

All output frequencies are generated from a 14.318-MHz crystal input. A reference clock input can be provided at the XIN input instead of a crystal. It is recommended to use the bypass mode of the internal oscillator in this case. Two phase-locked loops (PLLs) are used to generate the host frequencies and 48-MHz clock frequencies. On-chip loop filters and internal feedback eliminate the need for external components.

The device provides a standard mode (100 kbps) SMBus 1.1 serial interface for device control. The implementation is as a slave with read and write capability. The device address is specified in the SMBus serial interface device address table. Both SMBus inputs (SDATA and SCLK) provide integrated pullup resistors (typically 150 kΩ).

Seven 8-bit SMBus registers provide individual enable control for each of the outputs. The controllable outputs default to enabled at power up and can be placed in a disabled mode with a low-level output when a low-level control bit is written to the control register. The registers must be accessed in sequential order (i.e., random access of the registers not supported).

The CPU, PCI, PCI\_F, LDT, FDC (24/48-MHz), and USB (48-MHz) clock outputs provide low-skew/low-jitter clock signals for reliable clock operation. All outputs have 3-state capability, which can be selected via control inputs FS0, FS1, and FS2 at power-up preset condition.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

†LDT is equivalent to HT66 shown on AMD specification.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## 200-MHz CLOCK SYNTHESIZER/DRIVER

### WITH SPREAD SPECTRUM CAPABILITY AND DEVICE CONTROL INTERFACE

SCAS675 – APRIL 2002

#### description (continued)

The CPU bus is a 3.3-V differential push-pull output type. All others are single-ended CMOS buffers.

The host frequencies are fixed and are controlled by the FS0, FS1 and FS2 signals at power-up. The CPU bus frequencies are 200, 166, 133 and 100 MHz.

Because the CDC960 is based on PLL circuitry, it requires a stabilization time to achieve phase-lock of the PLL. With use of external reference clock, this signal must be fixed-frequency and fixed-phase prior stabilization time starts.

**Terminal Functions**

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
CPU[0:1], $\overline{\text{CPU}}[0:1]$	41, 37 40, 36	O	3.3-V, differential CPU clock outputs CPU Clock Outputs 0 and 1: CPU push-pull true clock outputs of the differential pair CPU Clock Outputs 0 and 1: CPU push-pull complementary clock outputs of the differential pair
FS[0:2] & REF[0:2]	1, 48, 45	I/O	3.3 V, 14.318-MHz clock outputs Frequency Select inputs: Power-on strapping to set device operating frequency as described in the Device Frequency Select Functions table. These inputs have 150-k $\Omega$ internal pullup resistors. Low = 0, High = 1. 3.3-V reference clock outputs: Fixed clock output at 14.318 MHz
GND	5, 10, 15, 20, 27, 30, 34, 39, 47	G	Power Connection: Connected to V <sub>SS</sub> . Used to ground digital portions of the chip
GND <sub>A</sub>	42	G	Analog GND: Connected to V <sub>SS</sub> through filter. Used to ground the main CPU-PLL on the chip
GND <sub>F</sub>	33	G	Analog GND for 48-MHz PLL: Connected to V <sub>SS</sub> through filter. Used to ground the 48-MHz PLL on the chip
$\overline{\text{LDT\_Stop}}$	12	I	Control for 66-MHz PCI clocks: Active LOW control input to halt all 66-MHz PCI clocks except the free-running clock. This input has a 150-k $\Omega$ internal pullup resistor. Once this input has been asserted, PCI/LDT outputs if operating at 66-MHz must stop in the low state within 1 $\mu$ s. Low = stop, High = running
PCI[0:5]	13, 14, 17, 18, 21, 22	O	3.3-V PCI clock outputs divided down from CPU-PLL 3.3-V PCI clock outputs: PCI clocks operate at 33 MHz.
PCI <sub>F</sub>	23	O	3.3-V, 33-MHz clocks divided down from CPU-PLL 3.3-V Free-Running PCI clock output: The free-running PCI clock pin operates at 33 MHz. The free-running PCI clock is not turned off when PCI_Stop# is activated LOW.
PCI/LDT[0:2]	7, 8, 11	O	3.3-V PCI 33-MHz or LDT 66-MHz outputs: This group of outputs is selectable between 33 MHz and 66 MHz based upon the state of PCI/LDT_SEL. When running at 66 MHz these outputs are for use as reference clocks to LDT devices.
$\overline{\text{PCI/LDT\_SEL}}$	6	I	PCI 33-MHz/LDT 66-MHz Select: This input selects the output frequency of PCI/LDT outputs to either 33 MHz or 66 MHz. This is a dedicated input pin to avoid corruption of the input state due to PCI add-in cards that may have termination resistors on the input clocks. This input has a 150-k $\Omega$ internal pullup resistor. Low = 66-MHz outputs, High = 33-MHz outputs
PCI_Stop	24	I	3.3-V LVTTTL-compatible input for PCI_Stop active low Control for 33-MHz PCI clocks: Active LOW control input to halt all 33-MHz PCI clocks except the free-running clock. This input has a 150-k $\Omega$ internal pullup resistor. Once this input has been asserted, the PCI outputs and PCI/LDT outputs operating at 33 MHz must stop in the low state within 1 $\mu$ s. Low = stop, High = running
SCLK	25	I	SMBus compatible SCLK. Clock pin for SMBus circuitry (SMBus revision 1.1). This input has an internal pull-up resistor of 150 k $\Omega$ . SCLK is a 3.6-V tolerant signal input. High impedance at power down is not supported.
SDATA	26	I/O	SMBus compatible SDATA Data pin for SMBus circuitry (SMBus revision 1.1). This output is open drain and has an internal pullup resistor of 150 k $\Omega$ . SDATA is a 3.6V tolerant signal IO. High impedance at power down is not supported.
SPREAD	44	I	Spread Spectrum Clocking Enable: Power-on strapping to set spread spectrum clocking as enabled or disabled. This input allows the default spread spectrum clocking mode to be enabled or disabled upon power up. This input has a 150-k $\Omega$ internal pullup resistor. Low = disable, High = enable. Note that all Athlon and Hammer systems are recommended to use SSC; therefore, the default of this pin is enabled and should only be turned off for debug and test purposes.
USB	31	O	3.3-V, fixed 48-MHz non-SSC clock output 3.3-V USB clock output: Fixed clock output at 48 MHz
V <sub>DD</sub>	2, 9, 16, 19, 29, 35, 38, 46	P	Power Connection: Connected to 3.3-V power supply. Used to supply digital portions of the chip

V <sub>DDF</sub>	32	P	Analog V <sub>DD</sub> for 48-MHz PLL: Connected to 3.3-V power supply through filter. Used to supply the 48-MHz PLL on the chip
XIN	3	I	Crystal input – 14.318 MHz Crystal Connection or External Reference: Reference crystal input or external reference clock input. This pin includes an internal 36-pF load capacitance to eliminate the need for an external load capacitor.
XOUT	4	O	Crystal output – 14.318 MHz Crystal Connection: Reference crystal feedback. This output includes an internal 36-pF load capacitance to eliminate the need for an external load capacitor.
$\overline{24/48\_SEL}$ & FDC	28	I/O	3.3-V super I/O clock output: The super I/O clock can be strapped for 24 MHz or 48 MHz. This input has a 150-k $\Omega$ internal pullup resistor. Low = 48-MHz output, High = 24-MHz output

**connecting SCLK and SDATA to 5-V SMBus signals**

SCLK and SDATA of CDC960 have been designed to work within a 3.3-V supply voltage environment only. In order to connect SCLK and SDATA to a 5-V SMBus configuration, external circuitry is required. A simple and inexpensive solution is to use clamping diodes. Two approaches are recommended for this solution:

1. **Using Zener diode to clamp to GND in reverse-biased direction**

**Figure 1. SCLK SDATA Connection to 5-V SMBus Using Zener Diode**

Zener diode D1 in Figure 1 is chosen such that the Zener voltage ( $V_{ZK}$ ) cannot exceed 300 mV above  $V_{DD}$  of the CDC960. The minimum value of  $V_{ZK}$  must be greater than 2.1 V to meet minimum requirement for  $V_{IH}$  of the CDC960. The value of R1 is chosen to satisfy requirements both for  $I_{OH}$  of the driver of SCLK and SDATA and for  $V_{OL}$  and  $I_{OL}$  of SDATA of CDC960.

$$I_{OH} \leq \frac{V_O - V_{IO}}{(R1 + R_S)} \quad (\text{For the driver of SCLK and SDATA. } R_S \text{ is the source driver impedance.}) \tag{1}$$

$$2 \text{ mA} \leq \frac{0.8 \text{ V}}{R1 + Z_O} \leq 6 \text{ mA} \quad (\text{For a SDATA of CDC960, } 25 \Omega < Z_O < 47 \Omega) \tag{2}$$

$$(R1 + Z_O) \times 1.75 \text{ mA} < 0.4 \text{ V} \quad (\text{For a SDATA of CDC960, } 25 \Omega < Z_O < 47 \Omega) \tag{3}$$

**connecting SCLK and SDATA to 5-V SMBus signals (continued)**

There are many manufacturers making Zener diodes that can be used for this application. Panasonic MA8033 and Vishay BZX84C3V3 that have  $3.1\text{ V} < V_Z < 3.5\text{ V}$  can be used for this application. In this case R1 is recommended as  $150\ \Omega$ .

The worst  $I_{OH}$  in equation (1) is 16 mA when  $V_{OH} = 5.5\text{ V}$ ,  $R_S = 0\ \Omega$  and  $V_{IO} = 3.1\text{ V}$ .

The current in equation (2), between 4 mA and 4.6 mA, satisfies the requirement.

Equation (3) is also satisfied with the selected R1 and diode.

**2. Clamping Diode to  $V_{DD}$**

**Figure 2. SCLK SDATA Connection to 5-V SMBus Using Clamping Diode to  $V_{DD}$**

Diode D1 in Figure 2 should have a small forward voltage ( $V_F$ ). Ideally, we want  $V_F$  to be less than 300 mV to meet the input voltage requirement of the CDC960. International IOR Rectifier has a device (part number 10BQ015) with maximum  $V_F$  of 350 mV at 1.0 A. Using the 10BQ015 with  $R1 = 150\ \Omega$ , the worst-case  $I_{OH}$  is calculated using equation (4).

$$I_{OH} = \frac{5.5\text{ V} - (3.0 - 0.35)\text{ V}}{150\ \Omega} = 14\text{ mA} \tag{4}$$

The calculation for equations (2) and (3) is the same as in part 1.

When using the configuration in Figure 2, the power supply is required to have a capability of sinking current. The total amount of sinking current is dependent on the overall load connected to that power supply.

Using the above interface circuitry with a high-impedance source, the available high-level voltage on the SMBus is limited to about  $(V_{zk})$  for the configuration in Figure 1 and  $(V_{DD}(\text{CDC960}) + V_F(\text{D1}))$  for the configuration in Figure 2. One has to choose which option best fits a given SMBus configuration.

Actually, the typical SMBus configuration is an open-drain configuration with pullup resistors to the corresponding power supply. It does not require a 5-V SMBus driver that has a low impedance to drive the CDC960 SMBus ports with its additional components as shown in Figure 1 and Figure 2. The external components are not needed if the pullup resistors of the SMBus are directly connected to a voltage equal to the supply voltage of the CDC960 (typically 3.3 V). This pullup resistor connection is strongly recommended.

# CDC960 200-MHz CLOCK SYNTHESIZER/DRIVER WITH SPREAD SPECTRUM CAPABILITY AND DEVICE CONTROL INTERFACE

SCAS675 – APRIL 2002

## power-up sequences

Sampled inputs are: FS0, FS1, FS2 and  $\overline{24/48\_SEL}$ .

State S1 is an analog controlled delay derived from internal reference voltages to ensure that a valid input state is captured. There is no specific delay in this state after power up.

Figure 3 shows the symbolic sequence of the CDC960 during power up. States S0–S4 are required to ensure proper configuration and operation of the device functions.

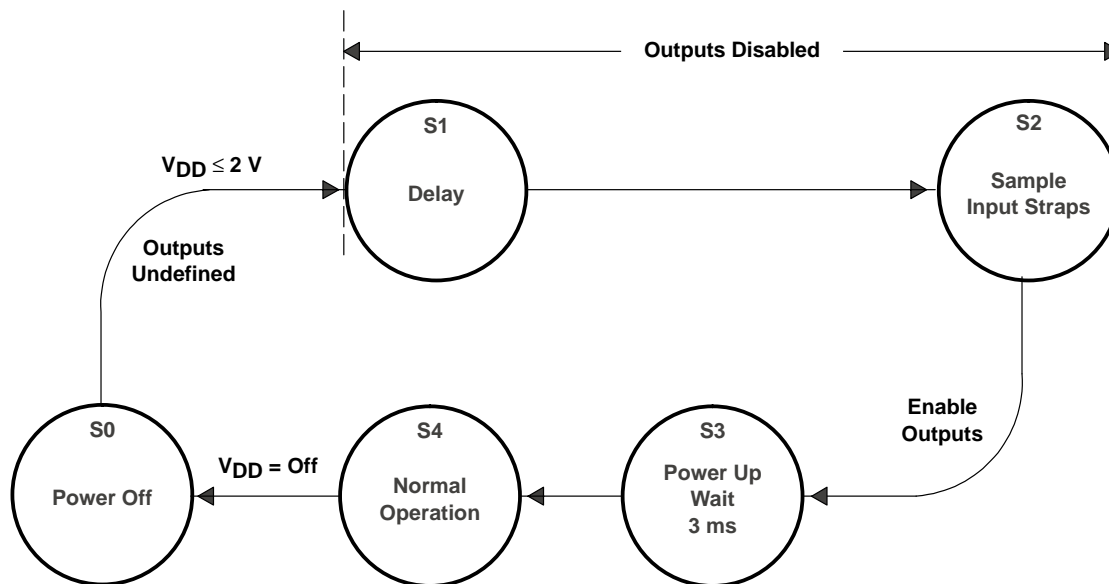

Figure 3. Power-Up State Transitions

## SMBus serial interface

The following section describes the SMBus interface programming.

In general the CDC960 SMBus protocol supports only block write and block read operations.

### SMBus device address

A6	A5	A4	A3	A2	A1	A0	R/W
1	1	0	1	0	0	1	0

0 = write to CDC960  
1 = read from CDC960

### writing to the SMBus interface

1. Send the address D2(H) and validate the acknowledge from the slave.
2. Send the dummy byte as a command code and validate the acknowledge from the slave.
3. Send the number of data bytes to write and validate the acknowledge from the slave.
4. Write the desired data bytes to registers and validate the acknowledge from the slave for each data byte.

Clock Generator Addr (7 bits)	ACK	+8 bits dummy command code	ACK	+8 bits byte count	ACK	Data byte 0	ACK	Data byte N	ACK
A(6:0) & R/W									
D2(H)									

**SMBus serial interface (continued)**

**reading the SMBus interface, using address pre-phase**

1. Send the address  $D2_{(H)}$  and validate the acknowledge from the slave.
2. Send dummy byte as command code and validate the acknowledge from the slave.
3. Send repeated start condition followed by address  $D3_{(H)}$  and validate the acknowledge from the slave.
4. The slave returns the number of bytes it is going to send (byte count) and validates the acknowledge from the master.
5. Read back the desired data bytes and validate the acknowledge sent by the master for each data byte.

Clock Generator Addr (7 bits)	ACK	+8 bits dummy command code	ACK	Repeated Start	Clock Generator Addr (7 bits)	ACK	+8 bit byte count	ACK by master	Data byte 0	ACK by master	Data byte N	ACK by master
A(6:0) & R/W					A(6:0) & R/W							
$D2_{(H)}$					$D3_{(H)}$							

**reading the SMBus interface, using direct read**

1. Send the address  $D3_{(H)}$  and validate the acknowledge from the slave.
2. The slave returns the number of bytes it is going to send (byte count) and validates the acknowledge from the master.
3. Read back the desired data bytes and validate the acknowledge sent by the master for each data byte.

Clock Generator Addr (7 bits)	ACK	+8 bit byte count	ACK by master	Data byte 0	ACK by master	Data byte N	ACK by master
A(6:0) & R/W							
$D3_{(H)}$

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)															
7	R/W	L	Write disable (write once). A 1 written to this bit after a 1 has been written to Byte0, Bit0 disables modification of all configuration registers until the device has been powered off.	—	Register value															
6	R/W	L	Spread spectrum enable. This bit provides a software programmable control for spread spectrum clocking. The truth table for SSC is as follows:	—	Register value															
			<table border="1"> <thead> <tr> <th>Spread (ext. Pin)</th> <th>Byte0, Bit6</th> <th>SSC Function</th> </tr> </thead> <tbody> <tr> <td>L</td> <td>L</td> <td>Disabled</td> </tr> <tr> <td>L</td> <td>H</td> <td>Enabled</td> </tr> <tr> <td>H</td> <td>L</td> <td>Enabled</td> </tr> <tr> <td>H</td> <td>H</td> <td>Enabled</td> </tr> </tbody> </table>			Spread (ext. Pin)	Byte0, Bit6	SSC Function	L	L	Disabled	L	H	Enabled	H	L	Enabled	H	H	Enabled
			Spread (ext. Pin)			Byte0, Bit6	SSC Function													
			L			L	Disabled													
			L			H	Enabled													
H	L	Enabled																		
H	H	Enabled																		
5	R/W	L	FS4 (corresponds to frequency selection table)	—	Register value															
4	R/W	L	FS3 (corresponds to frequency selection table)	—	Register value															
3	R/W	Externally selected‡	FS2 (corresponds to frequency selection table). If write is enabled, this bit can be set differently than the power-up condition.	—	45 at power up															
2	R/W	Externally selected‡	FS1 (corresponds to frequency selection table). If write is enabled, this bit can be set differently than the power-up condition.	—	48 at power up															
1	R/W	Externally selected‡	FS0 (corresponds to frequency selection table). If write is enabled, this bit can be set differently than the power-up condition.	—	1 at power up															
0	R/W	L	Write Enable. A 1 written to this bit after power up enables modification of all configuration registers and subsequent 0s written to this bit disable modification of all configuration registers except this single bit. Note that when a 1 has been written to Byte0, Bit 7, all modification is permanently disabled until the device power cycles. Note also, that block write transactions to the interface are completed. However, unless the interface has been previously unlocked, the writes have no effect.	—	Register value															

† PUD = Power-up condition

‡ The value of this bit is according to level applied to corresponding device pin at power up.

NOTE 1: Byte0, Bit0 controls the write enable status for the device SMBus. If a 1 is written to Byte0, Bit0, the SMBus registers are write enabled. Once write has been enabled, a new block write protocol must be sent to the device to program the desired register values. Once after power up a 1 is written to Byte0, Bit0, the device functionality is according to the settings of the different registers. E.g., the device function table is according to setting of Bits[1...6] of Byte0 and other functions are according to corresponding SMBus register settings. If a 0 is written to Byte0, Bit0, write is disabled and the device function is according to the previous settings of the last write cycle.

**Byte 1: PCI Clock Control Register (H = Enable, L = Disable)**

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)

**Byte 2: PCI Clock USB FDC and REF Control Register**

(H = Enable, L = Disable)

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)
7	R/W	H	CPU1 enable‡	36, 37	Register value
6	R/W	H	CPU0 enable‡	40, 41	Register value
5	R/W	H	REF2 enable	45	Register value
4	R/W	H	REF1 enable	48	Register value
3	R/W	H	REF0 enable	1	Register value
2	R/W	H	FDC (24_48 MHz) enable	28	Register value
1	R/W	H	USB enable	31	Register value
0	R/W	H	PCI/LDT2 enable	11	Register value

† PUD = Power-up condition

‡ If a CPU clock is disabled by setting its control bit (bit 6 or bit 7) low, both the CPU and  $\overline{\text{CPU}}$  outputs for the disabled clock are set low.

**Byte 3: PCI Clock Free Running Control Register**

(H = Free running, L = controlled by  $\overline{\text{PCI\_Stop/LDT\_Stop}}$ )

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)
7	R/W	L	PCI/LDT1 free-running enable§	8	Register value
6	R/W	L	PCI/LDT0 free-running enable§	7	Register value
5	R/W	L	PCI5 free-running enable§	22	Register value
4	R/W	L	PCI4 free-running enable§	21	Register value
3	R/W	L	PCI3 free-running enable§	18	Register value
2	R/W	L	PCI2 free-running enable§	17	Register value
1	R/W	L	PCI1 free-running enable§	14	Register value
0	R/W	L	PCI0 free-running enable§	13	Register value

† PUD = Power-up condition

§ The above individual free-running enable/disable controls are intended to allow individual clock outputs to be made free running. A clock output that has its free-running bit enabled (set to H) is not turned off with the assertion of either  $\overline{\text{PCI\_Stop}}$  or  $\overline{\text{LDT\_Stop}}$ . If a particular bit is disabled in Byte1, the Byte1 settings overwrite the Byte3 settings.

**SMBus configuration command bitmap (continued)**

**Byte 4: Pin Latched/Real Time State Control Register (see Note 2) (H = Enable, L = Disable)**

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)
7	R/W	H	PCI_F enable	23	Register value
6	R	Externally selected‡§	SPREAD actual pin state		44
5	R	Externally selected‡	$\overline{24/48\_SEL}$ pin power up latched state		28 at power up
4	R	Externally selected‡§	$\overline{PCI/LDT\_SEL}$ actual pin state		6
3	R	Externally selected‡	FS2 power-up latched pin state		45 at power up
2	R	Externally selected‡	FS1 power-up latched pin state		48 at power up
1	R	Externally selected‡	FS0 power-up latched pin state		1 at power up
0	R/W	L	PCI/LDT2 free-running enable¶	11	Register value

† PUD = Power-up condition

‡ The value of this bit is determined by the level applied to the corresponding device pin at power up.

§ If the SMBus is in read mode, and the byte-count byte is being sent, the device input pin is sampled again at the falling edge of SCLK at the same state as the acknowledge state for the byte count that is initiated by SCLK↓.

¶ The above individual free running enable/disable controls are intended to allow individual clock outputs to be made free running. A clock output that has its free-running bit enabled (set to H) is not turned off with the assertion of either PCI\_Stop or LDT\_Stop. If a particular bit is disabled in Byte2, the Byte2 settings overwrite the Byte4 settings.

NOTE 2: Byte4 holds the power-up information for pins latched at power up. In the case that an unintentional write has been made to these bits of Byte4, the SMBus write is ignored; the bits always return the power-up latched value during an SMBus read operation.

This does not relate to the bits which hold the actual (current) pin state. Those bits can not be overwritten by software in order to get the hardware setting states back via software.

**Byte 5: Vendor Identification Register (H = Enable, L = Disable)**

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)
7	R	H	Manufacturer ID (MSB)	–	Returns H
6	R	H	Manufacturer ID	–	Returns H
5	R	H	Manufacturer ID, TI is shown for vendor ID = 111	–	Returns H
4	R	L	Device revision ID (MSB)	–	Returns L

SCAS675 – APRIL 2002

**SMBus configuration command bitmap (continued)**

**Byte 8: Vendor Specific Register (reserved)**

**(H = Enable, L = Disable)**

BIT	TYPE	PUD†	DESCRIPTION	PIN AFFECTED (WRITE OPERATION)	SOURCE PIN (READ OPERATION)
7	R/W	L	Trigger single pulse at the L-to-H transition of this bit after an SMBus write cycle completes. This bit must be written back to L in order to trigger a following pulse with a new L-to-H transition at the completion of a write protocol.	CPU, $\overline{\text{CPU}}$	Register value
6	R/W	L	Single-pulse ARM bit H = enable, L = disable single-pulse feature	–	Register value
5	R/W	L	Must set to L during the byte write	–	Register value
4	R/W	L	Must set to L during the byte write	–	Register value
3	R/W	L	Must set to L during the byte write	–	Register value
2	R/W	L	Must set to L during the byte write	–	Register value
1	R/W	L	Must set to L during the byte write	–	Register value
0	R/W	L	Must set to L during the byte write	–	Register value

† PUD = Power-up condition

Single-pulse initialization

1. Device is in normal operating mode (frequencies selected by FS[4:0] as usual).
2. Put device into SMBus mode (set write enable bit according to specification).
3. Put device into required operating mode via the SMBus.
4. Set Byte8/Bit6 to H. Byte8 is a TI control byte, Bit6 is the ARM bit.
  - a. The device continues running as in the normal operating mode, but the CPUx/ $\overline{\text{CPUx}}$  outputs are pulled to low/high, respectively; i.e., the clock is low.
  - b. All other clocks (PCI, LDT66, USB, 48-MHz, REFCLOCK) continue running as long as they are not disabled by the SMBus or other means.
5. Set Byte8/Bit7 to H. Byte8/Bit 7 is the SHOOT bit.
  - a. The device recognizes a rising edge on this bit and sends a single high pulse on CPUx. The  $\overline{\text{CPUx}}$  output is complementary (low). The pulse duration depends on frequency settings for the CPU-BUS (half of the period).
  - b. CPU1 or  $\overline{\text{CPU0}}$  can still be enabled/disabled via the SMBus as usual.
6. Set Byte8/Bit7 back to L for the next shot.
  - a. Because the device only detects L→H transitions, this bit must be reset to L.
7. Now the device is ready for the next pulse (write H to Byte8/Bit7).
8. When setting the ARM bit to L, the single-shot feature is disabled and the device runs as usual.

### spread spectrum clock (SSC) implementation for CDC960

Simultaneously switching at a fixed frequency generates a significant power peak at the selected frequency, which in turn causes an EMI disturbance to the environment. The purpose of the internal frequency modulation of the CPU-PLL is to distribute the energy to many different frequencies, thus reducing the power peak.

A typical characteristic for a single-frequency spectrum and a modulated-frequency spectrum is shown in Figure 4.

**Figure 4. Frequency Power Spectrum With and Without the Use of SSC**

The modulated spectrum has its distribution to the left side of the single-frequency spectrum, which indicates a *down-spread modulation*.

The peak reduction depends on the modulation scheme and modulation profile. System performance and timing requirements are the limiting factors for actual design implementations. The implementation is driven to keep the average clock frequency close to its upper specification limit. The modulation amount is set to  $-0.5\%$ .

In order to allow a downstream PLL to follow the frequency modulated signal, the bandwidth of the modulation signal is limited in order to minimize SSC-induced tracking skew jitter.

**WITH SPREAD SPECTRUM CAPABILITY AND DEVICE CONTROL INTERFACE**

SCAS675 – APRIL 2002

**absolute maximum ratings over operating free-air temperature (unless otherwise noted)†**

Supply voltage range, $V_{DD}$ .....	-0.5 V to 4.6 V
Input voltage range, $V_I$ (see Note 3) .....	-0.5 V to $V_{DD} + 0.5$ V
Voltage range applied to any output in the high-impedance state or power-off state, $V_O$ (see Note 3) .....	-0.5 V to $V_{DD} + 0.5$ V
Current into any output in the low state, $I_O$ .....	$2 \times$ rated $I_{OL}$
Input clamp current: $I_{IK} (V_I < 0)$ ..	-18 mA
$I_{IK} (V_I > V_{DD})$ .....	18 mA
Output clamp current: $I_{OK} (V_O < 0)$ .....	-50 mA
$I_{OK} (V_O > V_{DD})$ .....	50 mA
Package thermal impedance, $\theta_{JA}$ (see Note 4) .....	95°C/W
Maximum power dissipation at $T_A = 55^\circ\text{C}$ (in still air) (see Note 5) .....	1.0 W
Operating free-air temperature range, $T_A$ .....	-0°C to 70°C
Storage temperature range, $T_{stg}$ .....	-65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds .....	260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 3. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.  
 4. The package thermal impedance is calculated in accordance with EIA/JEDEC Std JESD51, except for the through-hole packages, which use a trace length of zero. The absolute maximum power dissipation allowed at  $T_A = 55^\circ\text{C}$  (in still air) is 1.0 W.  
 5. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils. For more information, refer to the *Package Thermal Considerations* application note in the *ABT Advanced BiCMOS Technology Data Book*, literature number SCBD002.

**DISSIPATION RATING TABLE**

PACKAGE	$T_A \leq 25^\circ\text{C}$ POWER RATING	OPERATING FACTOR‡ ABOVE $T_A = 25^\circ\text{C}$	$T_A = 70^\circ\text{C}$ POWER RATING
DL	1.3 W	10.7 mW/°C	0.85 W

‡ This is the inverse of the traditional junction-to-case thermal resistance ( $R_{\theta JA}$ ) and uses a board-mounted device at 95°C/W.

$t_{stab}$	Stabilization time†	FS0, FS1, FS2 or SMBus update		0.03	3
		After power up		0.13	3

† Stabilization time is the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal. In order for phase lock to be obtained, a fixed-frequency, fixed-phase reference signal must be present at XIN. Until phase lock is obtained, the specifications for propagation delay and skew parameters given in the switching characteristics tables are not applicable. Stabilization time is defined as the time from when  $V_{DD}$  achieves its nominal operating level until the output frequency is stable and operating within specification.

$v_r$	Edge rate rising edge (maintained during total transition)			$V_{ref} = 20\% \text{ to } 60\% \text{ of } V_{DD}$		0.25	1.1	V/ns
$v_f$	Edge rate falling edge (maintained during total transition)					0.25	1.1	V/ns

† All typical values are measured at their nominal  $V_{DD}$  values.

‡ The average over any 1- $\mu\text{s}$  period of time is greater than the minimum specified period

SDATA,  $C_L = 10\text{ pF to }400\text{ pF}$ ,  $R_L = 1\text{ k}\Omega$

PARAMETER	FROM (INPUT)	TO (OUTPUT)	TEST CONDITIONS	MIN	TYP†	MAX	UNIT	
$t_{PHL}$	Propagation delay time‡	SCLK↓	Data acknowledge	See Figure 6		0.375	2	$\mu\text{s}$
$t_{PLH}$	Propagation delay time‡	SCLK↓	Data valid	See Figure 6		0.375	2	$\mu\text{s}$
$t_{PHL}$	Propagation delay time‡	SCLK↓	Data valid	See Figure 6		0.375	2	$\mu\text{s}$
$t_f$	Fall time		$C_L = 10\text{ pF}$		86	250	ns	
			$C_L = 400\text{ pF}$		115	250		

† All typical values are measured at their nominal  $V_{DD}$  values.

‡ This is a digital controlled delay. It equals to 6 REF clock cycles plus the internal gate delay (20 ns).

**PARAMETER MEASUREMENT INFORMATION**

LOAD CIRCUIT for t<sub>pd</sub> and t<sub>sk</sub>

LOAD CIRCUIT FOR t<sub>r</sub> and t<sub>f</sub>

VOLTAGE WAVEFORMS

VOLTAGE WAVEFORMS

VOLTAGE WAVEFORMS

- NOTES: A. C<sub>L</sub> includes probe and jig capacitance. C<sub>L</sub> = 10 pF (CPU), C<sub>L</sub> = 20 pF (USB, FDC, REF), C<sub>L</sub> = 30 pF (PCI, LDC)  
 B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.  
 C. All input pulses are supplied by generators having the following characteristics: PRR ≤ 14.318 MHz, Z<sub>O</sub> = 50 Ω, t<sub>r</sub> ≤ 2.5 ns, t<sub>f</sub> ≤ 2.5 ns.  
 D. The outputs are measured one at a time with one transition per measurement.

PARAMETER		3.3-V INTERFACE	UNIT
V <sub>IH_REF</sub>	High-level reference voltage	2.4	V
V <sub>IL_REF</sub>	Low-level reference voltage	0.4	V
V <sub>T_REF</sub>	Input threshold reference voltage	1.5	V
V <sub>O_REF</sub>	Off-state reference voltage	6	V

Figure 5. Load Circuit and Voltage Waveforms

**PARAMETER MEASUREMENT INFORMATION**

NOTE A: The repeat start condition is supported, but not clock stretching.

BYTE	DESCRIPTION
1	SMBus address
2	Command (dummy value, ignored)
3	Byte count
4	SMBus data byte 0
5 – N	SMBus data byte 1 – N

**Figure 6. Propagation Delay Times,  $t_r$  and  $t_f$**

**PARAMETER MEASUREMENT INFORMATION**

NOTE: Assertion and deassertion of  $\overline{\text{PCI\_STOP}}$  or  $\overline{\text{LDT\_STOP}}$  maintain signals duty cycle.

$t_{su}(\text{disable})$  is the time at which no pulse exists in following period.

$t_{su}(\text{enable})$  is the time at which a pulse exists in following period.

**Figure 7.  $\overline{\text{PCI\_Stop}}$  or  $\overline{\text{LDT\_Stop}}$   $\downarrow\uparrow$  to PCI (LDT)**

**PARAMETER MEASUREMENT INFORMATION**

$$t(sk_p) = |t_w(l) - t_w(h)| \quad \text{Duty Cycle} = \frac{t(\text{low or high})}{t_c} \times 100$$

Refer to Figure 4

a) Single-Ended Outputs

$$\text{Duty Cycle} = \frac{t_w(\text{Low or High})}{t_c} \times 100$$

b) Differential Output

**Figure 8. Waveforms for Calculation of Skew and Offset**

**PARAMETER MEASUREMENT INFORMATION**

Cycle-to-Cycle Jitter  $t_{jit(cc)} = |t_{c(n)} - t_{c(n+1)}|$  |  $n > 2 \times 10^3$

Mean Cycle Time  $t_0 = \frac{\sum_{n=1}^n t_{c(n)}}{n}$  |  $n > 2 \times 10^3$

a) Single-Ended Output

Cycle-to-Cycle Jitter  $t_{jit(cc)} = |t_{c(n)} - t_{c(n+1)}|$  |  $n > 2 \times 10^3$

Mean Cycle Time  $t_0 = \frac{\sum_{n=1}^n t_{c(n)}}{n}$  |  $n > 2 \times 10^3$

b) Differential Output

**Figure 9. Waveforms for Calculation of Jitter**

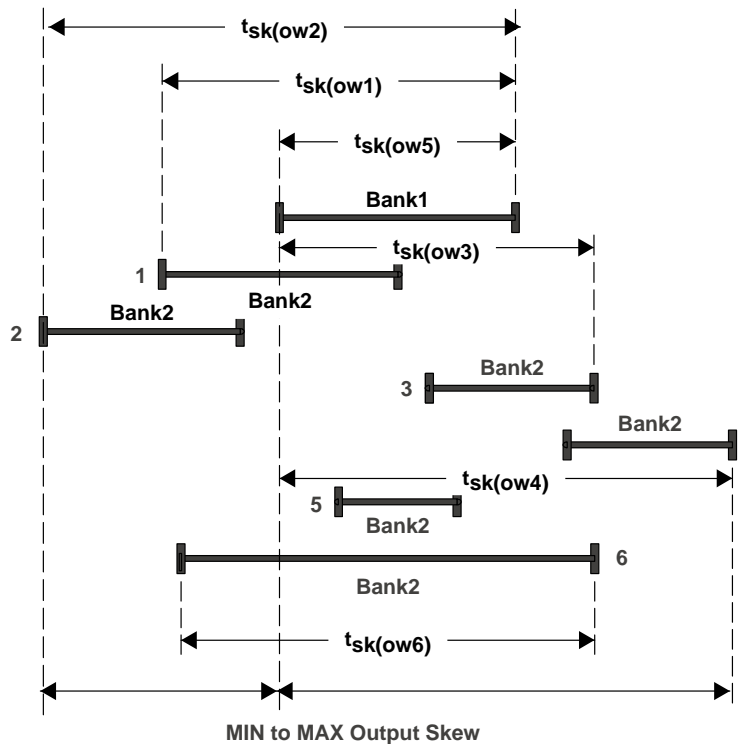

**PARAMETER MEASUREMENT INFORMATION**

**Figure 10. Load Circuit and Voltage Waveforms for CPU Bus**

**correction for measurements at 50 Ω nodes**

Voltage levels and readings are scaled for the voltage divider 200 Ω to 50 Ω versus all reads and reference levels must be multiplied/divided by the fixed scale of five.

**Figure 11. Bank and Output Skew;  $t_{sk(owx)}$ : Output Skew Window and MIN-to-MAX Phase**

**CDC960**  
**200-MHz CLOCK SYNTHESIZER/DRIVER**  
**WITH SPREAD SPECTRUM CAPABILITY AND DEVICE CONTROL INTERFACE**

SCAS675 – APRIL 2002

**PARAMETER MEASUREMENT INFORMATION**

The common mode voltage is measured single-ended and is the result of the following calculation:

$$V_{ocm}(t) = [V_o(CPUT)(t) + V_o(CPUC)(t)]/2$$

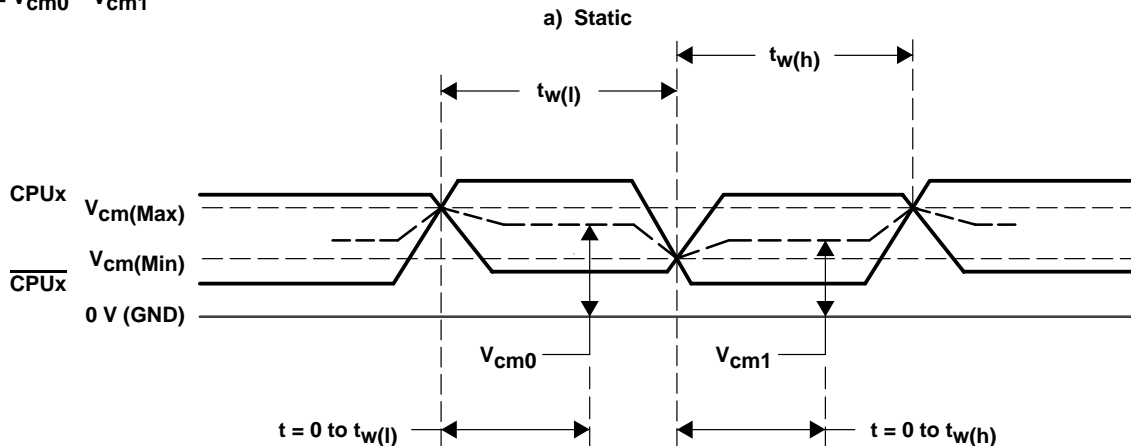

$V_{cm0}$  is calculated from the average of  $V_{ocm}$  within 45%–75% (region without switching noise) of the pulse while CPUx is in the LOW state.

$V_{cm1}$  is calculated from the average of  $V_{ocm}$  within 45%–75% (region without switching noise) of the pulse while CPUx is in the HIGH state.

$$V_{ocm} = (V_{cm0} + V_{cm1})/2$$

$$\Delta V_{ocm} = V_{cm0} - V_{cm1}$$

$$\Delta V_{ocm}(t) = \text{MAX}(V_{cm0}(t)) - \text{MIN}(V_{cm1}(t)) \text{ and}$$

$$\Delta V_{ocm}(t) = \text{MIN}(V_{cm0}(t)) - \text{MAX}(V_{cm1}(t))$$

b) Dynamic

**Figure 12. Common Mode Voltage**

**PARAMETER MEASUREMENT INFORMATION**

The differential voltage is measured single-ended and is the result of the following calculation:

$$V_{od(t)} = V_{o(CPUx)(t)} - V_{o(\overline{CPUx})(t)}$$

**Vod\_0** is calculated from the average of **Vod** within 45%–75% (region without switching noise) of the pulse while CPUx is in the LOW state.

**Vod\_1** is calculated from the average of **Vod** within 45%–75% (region without switching noise) of the pulse while CPUx is in the HIGH state.

$$V_{od} = (V_{od\_0} + V_{od\_1})/2$$

$$\Delta V_{od\_DC} = V_{od\_0} - V_{od\_1}$$

$$\Delta V_{od\_AC} = |V_{dif(max)}| - |V_{dif(min)}|$$

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
