# Quad, Rail-to-Rail, Fault-Protected, SPDT Analog Switch

## **General Description**

The MAX4533 quad, single-pole/double-throw (SPDT), fault-protected analog switch is pin-compatible with the industry-standard MAX333 and MAX333A. The MAX4533 features fault-protected inputs and Rail-to-Rail<sup>®</sup> signal handling. The normally open (NO\_) and normally closed (NC\_) terminals are protected from overvoltage faults up to  $\pm 25V$  with power on and up to  $\pm 40V$  with power off. During a fault condition, NO\_ and NC\_ become high impedance with only nanoamperes of leakage current flowing to the source. In addition, the output (COM\_) clamps to the appropriate polarity supply rail and provides up to  $\pm 10$ mA of load current. This ensures unambiguous rail-to-rail outputs when a fault occurs.

The MAX4533 operates from dual ±4.5V to ±18V power supplies or a single +9V to +36V supply. All digital inputs have +0.8V and +2.4V logic thresholds, ensuring both TTL and CMOS logic compatibility when using ±15V supplies or a +12V supply. On-resistance is 175 $\Omega$  max and is matched between switches to 10 $\Omega$  max. The off-leakage current is only 0.5nA at TA = +25°C and 10nA at TA = +85°C.

NPUTS V1 V2 V1 - V2 V1 - V2 V1 - V2 OSC IN MAX4533 V3 V3 - V4 FLYING CAPACITOR LEVEL TRANSLATOR (2-CHANNEL)

Typical Operating Circuit

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

N/XX/M

Features

- Rail-to-Rail Signal Handling
- ±40V Fault Protection with Power Off
  ±25V Fault Protection with ±15V Supplies
- + All Switches Off with Power Off
- No Power-Supply Sequencing Required During Power-Up or Power-Down

专业PCB打样工厂,24小时加急出货

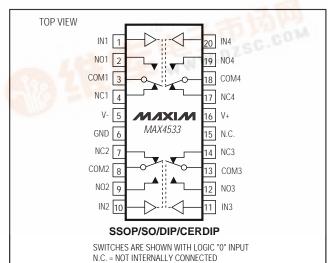

- Output Clamped to Appropriate Supply Voltage During Fault Condition—No Transition Glitch
- 1kΩ (typ) Output Clamp Resistance During Overvoltage
- 175Ω (max) Signal Paths with ±15V Supplies
- 20ns (typ) Fault Response Time
- ±4.5V to ±18V Dual Supplies +9V to +36V Single Supply
- Pin-Compatible with Industry-Standard MAX333/MAX333A
- TTL/CMOS-Compatible Logic Inputs with ±15V or Single +9V to +15V Supplies

Note 1: COM\_ and IN\_ pins are not fault protected. Signals on COM\_ or IN\_ exceeding V+ or V- are clamped by internal diodes. Limit forward diode current to maximum current rating.

**Note 2:** NC\_ and NO\_ pins are fault protected. Signals on NC\_ or NO\_ exceeding -25V to +25V may damage the device. These limits apply with power applied to V+ or V-. The limit is  $\pm 40V$  with V+ = V- = 0.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4, 7, 14, 17	NC1, NC2, NC3, NC4	Normally Closed Inputs*	
5	V-	Negative Analog Supply Voltage Input	
6	GND	Digital Ground	
15	N.C.	No Connection. Not internally connected.	
16	V+	Positive Analog and Digital Supply-Voltage Input	

\*When the voltage on NO\_ or NC\_ does not exceed V+ or V-, NO\_ (or NC\_) and COM\_ pins are bidirectional.

### **Detailed Description**

The MAX4533 is a fault-protected analog switch with special operation and construction. Traditional fault-protected switches are constructed using three-series CMOS devices. This combination produces good fault protection but fairly high on-resistance when the signals are within about 3V of each supply rail. These series devices are not capable of handling signals up to the power-supply rails.

The MAX4533 differs considerably from traditional faultprotected switches, with three advantages. First, it is constructed with two parallel FETs, allowing very low on-resistance when the switch is on. Second, they allow signals on the NC\_ or NO\_ pins that are within or slightly beyond the supply rails to be passed through the switch to the COM\_ terminal, allowing rail-to-rail signal operation. Third, when a signal on NC\_ or NO\_ exceeds the supply rails by about 150mV (a fault condition), the voltage on COM\_ is limited to the appropriate polarity supply voltage. Operation is identical for both fault polarities. The fault-protection extends to  $\pm 25V$  with power on and  $\pm 40V$  with power off.

The MAX4533 has a parallel N-channel and P-channel MOSFET switch configuration with input voltage sensors. The simplified internal structure is shown in Figure 1. The parallel N1 and P1 MOSFETs form the switch element. N3 and P3 are sensor elements to sample the input voltage and compare it against the power-supply rails.

MAX4533

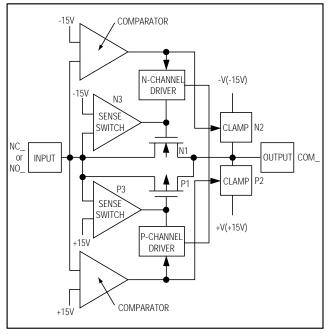

Figure 1. Simplified Internal Structure

During normal operation of a conducting channel, N1 and P1 remain on with a typical  $125\Omega$  on-resistance between NO\_ (or NC\_) and COM\_. If the input voltage exceeds either supply rail by about 150mV, the parallel combination switches (N1, P1) are forced off through the driver and sensing circuitries. At the same time, the output (COM\_) is clamped to the appropriate supply rail by the clamp circuitries (N2, P2). Two clamp circuits limit the output voltage to the supply voltages.

For simplicity, Figure 1 shows only one side of the SPDT switch configuration. The complete circuit is composed of two channels with their outputs connected.

#### Normal Operation

Two comparators continuously compare the voltage on the NO\_ (or NC\_ ) pin with V+ and V- supply voltages. When the signal on NO\_ (or NC\_ ) is between V+ and V-, the switch behaves normally, with FETs N1 and P1 turning on and off in response to NO\_ (or NC\_) signals (Figure 1). For any voltage between the supply rails, the switch is bidirectional; therefore, COM\_ and NC\_ (or NO\_ ) are interchangeable. Only NO\_ and NC\_ can be exposed to overvoltages beyond the supply range and within the specified breakdown limits of the device.

#### Fault Condition

The MAX4533 protects devices connected to its output (COM\_) through its unique fault-protection circuitry. When the input voltage is raised above either supply rail, the internal sense and comparator circuitries (N3 and N-channel driver or P3 and P-channel driver) disconnect the output (COM\_) from the input (Figure 1).

If the switch driven above the supply rail has an on state, the clamp circuitries (N2 or P2) connect the output to the appropriate supply rail. Table 1 summarizes the MAX4533's operation under normal and fault conditions. Row 5 shows a negative fault condition when the supplies are on. It shows that with supplies of  $\pm 15V$ , if the input voltage is between -15V and -25V, the output (COM\_) clamps to the negative supply rail of -15V. With this technique, the SPDT switch is capable of withstanding a worse-case condition of opposite fault polarities at its inputs.

#### **Transient Fault Condition**

When a fast rising or falling transient on NO\_ (or NC\_) exceeds V+ or V-, the output (COM\_) follows the input (IN\_) to the supply rail by only a few nanoseconds. This delay is due to the switch on-resistance and circuit capacitance to ground. However, when the input transient returns to within the supply rails there is a longer recovery time. For positive faults, the recovery time is typically 2.5 $\mu$ s. For negative faults, the recovery time is typically 1.3 $\mu$ s. These values depend on the COM\_ output resistance and capacitance. The delays are not dependent on the fault amplitude. Higher COM\_ output resistance and capacitance increase the recovery times.

#### Fault Protection, Voltage, and Power Off

The maximum fault voltage on the NO\_ or NC\_ pins is  $\pm 40V$  from ground when the power is off. With  $\pm 15V$  supply voltages, the highest voltage on NO\_ (or NC\_) can be +25V, and the lowest voltage on NO\_ (or NC\_) can be -25V. Exceeding these limits can damage the chip.

#### **IN\_ Logic-Level Thresholds**

The logic-level thresholds are TTL/CMOS-compatible when V+ is +15V. Raising V+ increases the threshold slightly; when V+ reaches +25V, the level threshold is 2.8V—higher than the TTL output high-level minimum of 2.4V, but still compatible with CMOS outputs (see the *Typical Operating Characteristics*).

Increasing V- has no effect on the logic-level thresholds, but it does increase the gate-drive voltage to the signal FETs, reducing their on-resistance.

### Table 1. Switch States in Normal and Fault Conditions

POWER SUPPLIES (V+, V-)	INPUT RANGE	NC_	NO_	OUTPUT
On	Between Rails	On	Off	NC_
On	Between Rails	Off	On	NO_
On	Between V+ and (+40V - V+)	On	Off	V+
On	Between V+ and (+40V - V+)	Off	On	V+
On	Between V- and (-40V - V-)	On	Off	V-
On	Between V- and (-40V - V-)	Off	On	V-
Off	Between Rails	Off	Off	Follows the load terminal voltage.

#### Failure Modes

The MAX4533 is not a lightning arrester or surge protector. Exceeding the fault-protection voltage limits on NO\_ or NC\_, even for very short periods, can cause the device to fail.

### \_Applications Information

#### Ground

There is no connection between the analog signal paths and GND. The analog signal paths consist of an N-channel and P-channel MOSFET with their sources and drains paralleled and their gates driven out of phase to V+ and V- by the logic-level translators.

V+ and GND power the internal logic and logic-level translators and set the input logic thresholds. The logic-level translators convert the logic levels to switched V+ and V- signals to drive the gates of the switches. This

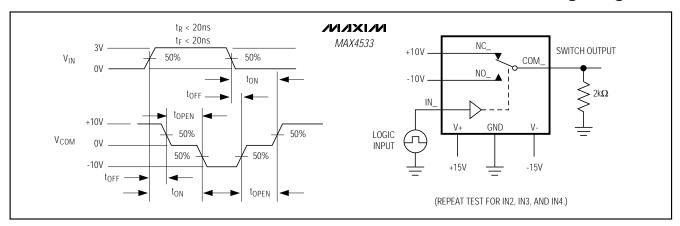

drive signal is the only connection between the power supplies and the analog signals. GND, IN\_, and COM\_ have ESD protection diodes to V+ and V-.

#### **Supply Current Reduction**

When the logic signals are driven rail-to-rail from 0 to +12V or -15V to +15V, the supply current reduces to approximately half of the supply current when the logic input levels are at 0 to 5V.

#### **Power Supplies**

The MAX4533 operates with bipolar supplies between  $\pm 4.5V$  and  $\pm 18V$ . The V+ and V- supplies need not be symmetrical, but their difference can not exceed the absolute maximum rating of +44V. The MAX4533 operates from a single supply between +9V and +36V when V- is connected to GND.

## \_Ordering Information (continued)

PART	TEMP. RANGE	PIN-PACKAGE
MAX4533CPP	0°C to +70°C	20 Plastic DIP
MAX4533EAP	-40°C to +85°C	20 SSOP
MAX4533ESP	-40°C to +85°C	20 Wide SO
MAX4533EPP	-40°C to +85°C	20 Plastic DIP
MAX4533MJP	-55°C to +125°C	20 CERDIP
