### 3. Electronic Shutter

The operation of the electronic shutter is controlled by the output of XSUB pulse during particular intervals.

#### <Shutter Modes>

SMD1 SMD2

L	L	Flickerless: Eliminates fluorescent frequency-induced flicker.
L	H	High-speed shutter: Shutter speed faster than 1/60 (NTSC), 1/50 (PAL)
H	L	Low-speed shutter: Shutter speed slower than 1/60 (NTSC), 1/50 (PAL)
H	H	No shutter operation.

#### <Shutter Mode and Speed Setting Method>

PS = High: Parallel input; set by ED0 to ED2, SMD1, and SMD2.

PS = Low: Serial input; set by inputting ED0 (strobe), ED1 (clock), and ED2 (data) to each pin.

**3-2. serial input (PS = L)**

For serial input (PS = L), SMD1 and SMD2 bits within ED2 (DATA) take priority over SMD1 (Pin 7) and SMD2 (Pin 9) pins as SMD1 and SMD2 (shutter mode control).

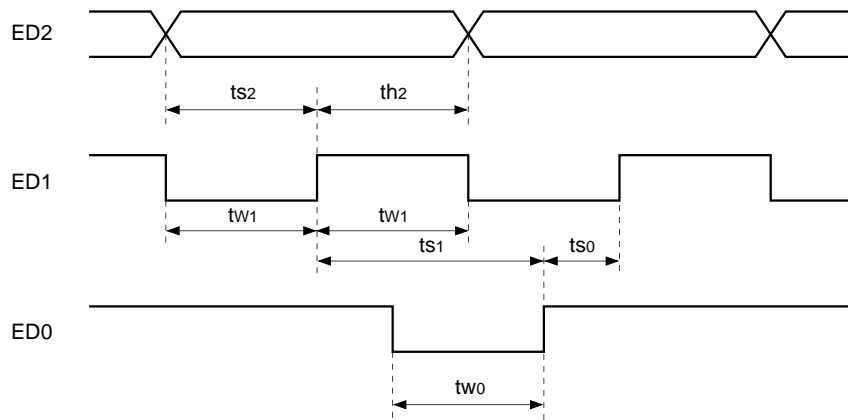

In this case, control by SMD1 and SMD2 pins is invalid.

ED2 data is latched to the register at the rise of ED1, and transferred to the within during the Low period of ED0.
