

VIDEO CONTROL COMBINATION

The TDA3501 is a monolithic integrated circuit performing the control functions in a PAL/SECAM decoder which additionally comprises the integrated circuits TDA3510 (PAL decoder) and/or TDA3520 (SECAM decoder).

The required input signals are: luminance and colour difference $-(R-Y)$ and $-(B-Y)$, while linear RGB signals can be inserted from an external source.

RGB signals are provided at the output to drive the video output stages.

The TDA3501 has the following features:

- capacitive coupling of the input signals
- linear saturation control
- $(G-Y)$ and RGB matrix
- insertion possibility of linear RGB signals, e.g. video text, video games, picture-in-picture, camera or slide-scanner
- equal black level for inserted and matrixed signals by clamping
- 3 identical channels for the RGB signals
- linear contrast and brightness control, operating on both the inserted and matrixed RGB signals
- horizontal and vertical blanking (black and ultra-black respectively) and black-level clamping obtained via a 3-level sandcastle pulse
- differential amplifiers with feedback-inputs for stabilization of the RGB output stages
- 2 d.c. gain controls for the green and blue output signals (white point adjustment)
- beam current limiting possibility

** All inputs pins 1, 21 and 22 are connected an internal bias voltage of 6 V is supplied.

CHARACTERISTICS (continued)**Sandcastle detector**

There are 3 internal thresholds (proportional to V_p)
the following amplitudes are required for
separating the various pulses:

horizontal and vertical blanking pulses (note 1)	V_{10-24}	>	2 V
		<	3 V
horizontal pulse (note 2)	V_{10-24}	>	4 V
		<	5 V
clamping pulse (note 3)	V_{10-24}	>	7,5 V
d.c. voltage for artificial black level (note 4) (scan and flyback)	V_{10-24}	>	7,5 V
no keying	V_{10-24}	<	1 V
Input current	$-I_{10}$	<	100 μ A

Notes

1. Blanking to ultra-black (-20%).
2. Insertion of artificial black level.
3. Pulse duration > 3,5 μ s.
4. This function will also be obtained by leaving pin 10 open.
