GENERAL DESCRIPTION

Output stage and protection circuit

Pin 5 is the output pin. The supply for the output stage is fed to pin 6 and the output stage ground is connected to pin 4. The output transistors of the class-B output stage can each deliver 0,75 A maximum. The 'upper' power transistor is protected against short-circuit currents to ground, whereas, during flyback, the 'lower' power transistor is protected against too high voltages which may occur during adjustments.

Moreover, the output transistors have been given extra solidity by means of special measures in the internal circuit layout.

A thermal protection circuit is incorporated to protect the IC against too high dissipation. This circuit is 'active' at 175 °C and then reduces the deflection current to such a value that the dissipation cannot increase.

Driver and switching circuit

Pin 1 is the input for the driver of the output stage. The signal at pin 1 is also applied via a resistor to pin 3 which is the input of a switching circuit. When the flyback starts, this switching circuit rapidly turns off the lower output stage and so limits the turn-off dissipation. It also allows a quick start of the flyback generator. Pin 3 is connected externally via resistors to pin 1 in order to allow for different applications in which pin 3 and pin 1 are driven separately.

Flyback generator

The capacitor at pin 6 is charged to a maximum voltage, which is equal to the supply voltage V_p (pin 9), during scan.

When the flyback starts and the voltage at the output pin (pin 5) exceeds the supply voltage (pin 9), the flyback generator is activated. The V_p is connected in series (via pin 8) with the voltage across the capacitor.

The voltage at the supply pin (pin 6) of the output stage will then be maximum twice V_p . Lower voltages can be chosen by changing the value of the external resistor at pin 8.

Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply of 6 V for drive of the output stage, so the drive current of the output stage is not affected by supply voltage variations. The stabilized voltage is available at pin 7.

A decoupling capacitor of 2,2 μ F can be connected to this pin.
