

TDA7309

DIGITAL CONTROLLED STEREO AUDIO PROCESSOR WITH LOUDNESS

- INPUT MULTIPLEXER:
3 STEREO INPUTS
- RECORD OUTPUT FUNCTION
- LOUDNESS FUNCTION
- VOLUME CONTROL IN 1dB STEPS
- INDEPENDENT LEFT AND RIGHT VOLUME CONTROL
- SOFT MUTE FUNCTION
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL I²C BUS

DESCRIPTION

The TDA7309 is a control processor with independent left and right volume control for quality audio applications. Selectable external loudness and soft mute functions are provided.

Control is accomplished by serial I²C bus micro-processor interface.

The AC signal setting is obtained by resistor net-

works and switches combined with operational amplifiers.

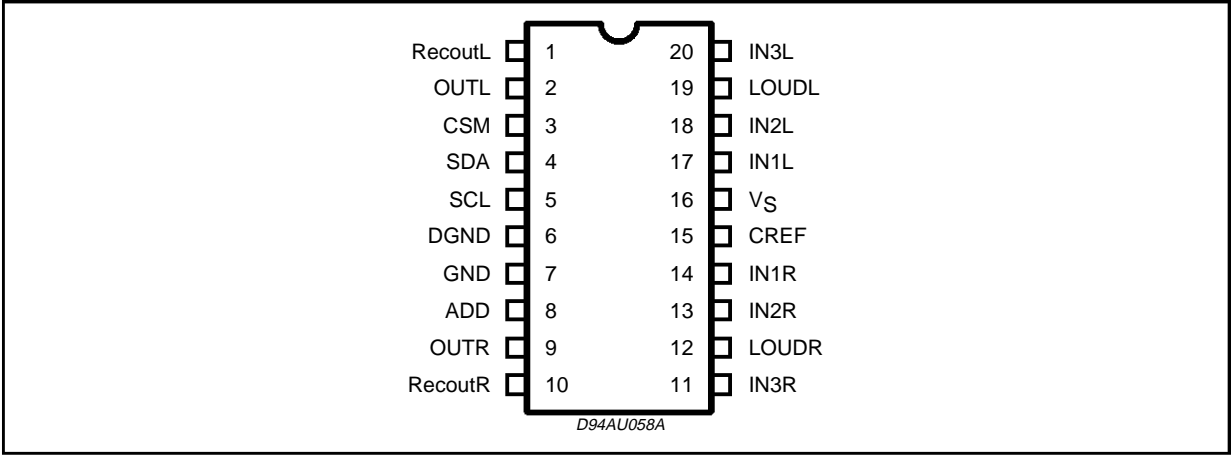

Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and Low DC stepping are obtained.

I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7313 and viceversa takes place thru the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

Data Validity

As shown in fig. 11, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

Start and Stop Conditions

As shown in fig. 12 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

Acknowledge

The master (μ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 13). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

Transmission without Acknowledge

Avoiding to detect the acknowledge of the audioprocessor, the μ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking and decreases the noise immunity.

SDA, SCL I²C BUS TIMING

Symbol	Parameter	Min.	Typ.	Max.	Unit
f_{SCL}	SCL clock frequency	0		400	kHz
t_{BUF}	Bus free time between a STOP and START condition	1.3			μs
$t_{HD:STA}$	Hold time (repeated) START condition. After this period, the first clock pulse is generated	0.6			μs
t_{LOW}	LOW period of the SCL clock	1.3			μs
t_{HIGH}	HIGH period of the SCL clock	0.6			μs
$t_{SU:STA}$	Set-up time for a repeated START condition	0.6			μs
$t_{HD:DA}$	Data hold time	0.300			μs
$t_{SU:DAT}$	Data set-up time	100			ns
t_R	Rise time of both SDA and SCL signals	20		300	ns (*)
t_F	Fall time of both SDA and SCL signals	20		300	ns (*)
$t_{SU:STO}$	Set-up time for STOP condition	0.6			μs

All values referred to $V_{IH \text{ min.}}$ and $V_{IL \text{ max.}}$ levels

(*) Must be guaranteed by the I²C BUS master.

Definition of timing on the I²C-bus

TDA7309

SOFTWARE SPECIFICATION

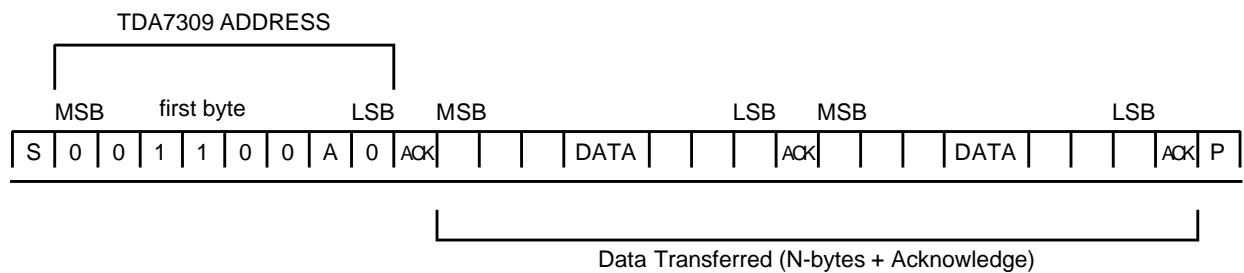

Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7309

address (the 8th bit of the byte must be 0). The TDA7309 must always acknowledge at the end of each transmitted byte.

- A sequence of data (N-bytes + acknowledge)
- A stop condition (P)

ACK = Acknowledge

S = Start

P = Stop

MAX CLOCK SPEED 100kbts/s
