

LOW COST DIGITALLY CONTROLLED AUDIO PROCESSOR

- INPUT MULTIPLEXER
 - 2 STEREO INPUTS
 - SELECTABLE INPUT GAIN FOR OPTIMAL ADAPTATION TO DIFFERENT SOURCES 2014
- ONE STEREO OUTPUT
- VOLUME CONTROL IN 1.0dB STEPS
- **TWO SPEAKER ATTENUATORS:**
- TWO INDEPENDENT SPEAKER CONTROL IN 1.0dB STEPS FOR BALANCE FACILITY
- INDEPENDENT MUTE FUNCTION
- ALL FUNCTION ARE PROGRAMMABLE VIA SERIAL BUS

DESCRIPTION

zsc.com

The TDA7449L is a volume control and balance (Left/Right) processor for quality audio applications in TV systems.

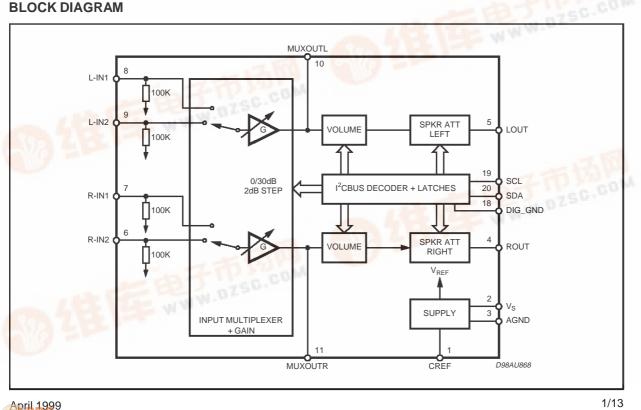

Selectable input gain is provided. Control of all the functions is accomplished by serial bus.

The AC signal setting is obtained by resistor net-

works and switches combined with operational amplifiers.

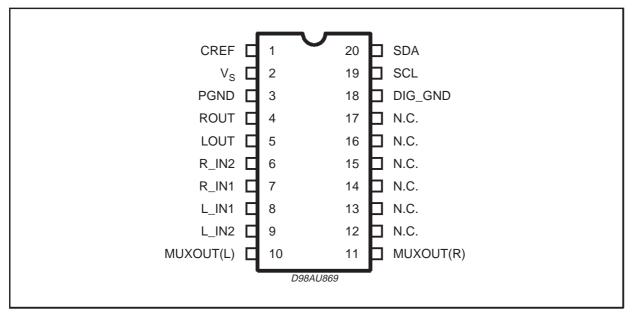

Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and DC stepping are obtained.

ABSOLUTE MAXIMUM RATINGS

| Symbol | Parameter | Value | Unit |
|------------------|-------------------------------|------------|------|
| Vs | Operating Supply Voltage | 10.5 | V |
| T _{amb} | Operating Ambient Temperature | -10 to 85 | °C |
| T _{stg} | Storage Temperature Range | -55 to 150 | °C |

PIN CONNECTION

THERMAL DATA

TEST CIRCUIT

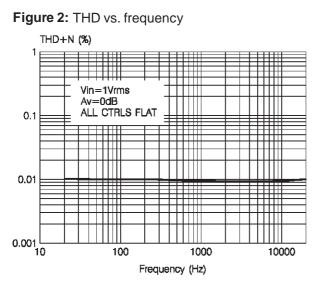

APPLICATION SUGGESTIONS

The first and the last stages are volume control blocks. The control range is 0 to -47dB (mute) for the first one, 0 to -79dB (mute) for the last one. Both of them have 1dB step resolution. The very high resolution allows the implementation of systems free from any noisy acoustical effect.

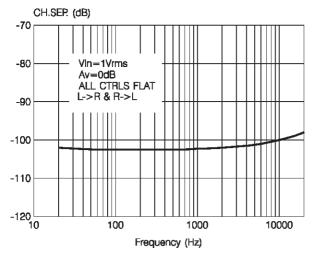

The TDA7449L audioprocessor provides 2 bands tones control.

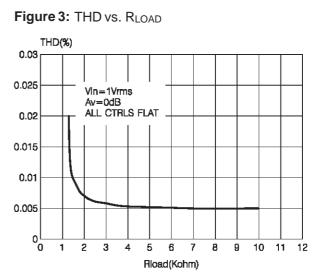

CREF

The suggested 10 μ F reference capacitor (CREF) value can be reduced to 4.7 μ F if the application requires faster power ON.

I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7449L and vice versa takes place through the 2 wires I^2C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

Data Validity

As shown in fig. 3, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

Start and Stop Conditions

As shown in fig.4 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an ac-

Figure 3: Data Validity on the I²CBUS

knowledge bit. The MSB is transferred first.

Acknowledge

The master (μ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 5). The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

The audio processor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

Transmission without Acknowledge

Avoiding to detect the acknowledge of the audio processor, the μ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

SOFTWARE SPECIFICATION

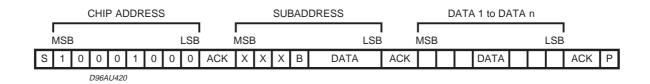

Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7449L

address

- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

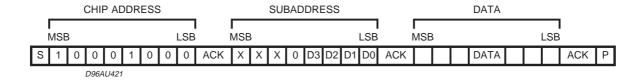

ACK = Acknowledge S = Start P = Stop A = AddressB = Auto Increment

EXAMPLES

No Incremental Bus

rect chip address, a subaddress with the B = 0 (no incremental bus), N-data (all these data concern the subaddress selected), a stop condition.

The TDA7449L receives a start condition, the cor-

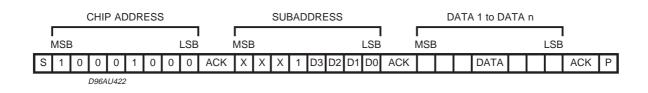

Incremental Bus

<u>(۲/</u>

The TDA7449L receive a start conditions, the correct chip address, a subaddress with the B = 1 (incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas

SUBADDRESS from "XXX1000" to "XXX1111" of DATA are ignored.

The DATA 1 concern the subaddress sent, and the DATA 2 concern the subaddress sent plus one in the loop etc, and at the end it receivers the stop condition.

POWER ON RESET CONDITION

| INPUT SELECTION | IN2 |
|-----------------|------|
| INPUT GAIN | 28dB |
| VOLUME | MUTE |
| SPEAKER | MUTE |

DATA BYTES

Address = 88 HEX (ADDR:OPEN). FUNCTION SELECTION: First byte (subaddress)

| MSB | | | | | | | LSB | SUBADDRESS | | |

B = 1: INCREMENTAL BUS ACTIVE

B = 0: NO INCREMENTAL BUS

X = DON'T CARE

In Incremental Bus Mode, the three "not used" functions must be addressed in any case. For example to refresh "Volume = 0dB" and Speaker_R = -40dB", the following bytes must be sent:

| SUBADDRESS | XXX10010 |
|-----------------|----------|
| VOLUME DATA | X000000 |
| NOT USED 1 DATA | XXXX1111 |
| NOT USED 2 DATA | XXXX1111 |
| NOT USED 3 DATA | XXXX1111 |
| SPEAKER_R DATA | X0000010 |
