MAXIM

Improved, Quad, SPST Analog Switches

General Description

Maxim's redesigned DG444/DG445 analog switches now feature on-resistance matching (4Ω max) between switches and guaranteed on-resistance flatness over the signal range (9Ω max). These low on-resistance switches conduct equally well in either direction. They guarantee low charge injection (10pC max), low power consumption (35 μ W max), and an ESD tolerance of 2000V minimum per Method 3015.7. The new design offers lower off leakage current over temperature (less than 5nA at +85°C).

The DG444/DG445 are quad, single-pole/single-throw (SPST) analog switches. The DG444 has 4 normally closed switches and the DG445 has 4 normally open switches. Switching times are less than 250ns for t_{ON} and less than 70ns for t_{OFF} . Operation is from a single +10V to +30V supply, or bipolar ± 4.5 V to ± 20 V supplies. Maxim's improved DG444/DG445 continue to be fabricated with a 44V silicon-gate process.

Applications

Sample-and-Hold Circuits	Communication Systems
Test Equipment	Battery-Operated Systems
Heads-Up Displays	PBX, PABX
Guidance and Control Systems	Audio Signal Routing
Military Radios	Modems/Faxes

New Features

- ♦ Plug-In Upgrades for Industry-Standard DG444/DG445
- ♦ Improved r_{ON} Match Between Channels (4Ω max)
- ♦ Guaranteed $r_{FLAT(ON)}$ Over Signal Range (9Ω max)
- ♦ Improved Charge Injection (10pC max)
- ♦ Improved Off Leakage Current Over Temperature (<5nA at +85°C)
- ♦ Withstand Electrostatic Discharge (2000V min) per Method 3015.7

Existing Features

- ♦ Low $r_{DS(ON)}$ (85 Ω max)
- ♦ Single-Supply Operation +10V to +30V
Bipolar-Supply Operation ± 4.5 V to ± 20 V
- ♦ Low Power Consumption (35 μ W max)
- ♦ Rail-to-Rail Signal Handling
- ♦ TTL/CMOS-Logic Compatible

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-

V+44V

GND25V

V_L(GND -0.3V) to (V+ +0.3V)

Digital Inputs V_S, V_D (Note 1)(V- -2V) to (V+ +2V) or 30mA
(whichever occurs first)

Continuous Current (any terminal)30mA

Peak Current, S or D (pulsed at 1ms, 10% duty cycle max) :100mA

Continuous Power Dissipation (T_A = +70°C)

16-Pin Plastic DIP (derate 10.53mW/°C above +70°C) 842mW

16-Pin Narrow SO (derate 8.70mW/°C above +70°C) ..696mW

Operating Temperature Ranges

DG444C/DG445C0°C to +70°C

DG444D/DG445D-40°C to +85°C

Storage Temperature Range-65°C to +150°C

Lead Temperature (soldering, 10sec)+300°C

Note 1: Signals on S, D, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Dual Supplies

(V+ = 15V, V- = -15V, V_L = 5V, GND = 0V, V_{INH} = 2.4V, V_{INL} = 0.8V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted.)

Note 2: Typical values are for **design aid only**, are not guaranteed and are not subject to production testing. The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: On-resistance match between channels and flatness are guaranteed only with bipolar-supply operation. Flatness is defined as the difference between the maximum and the minimum value of on-resistance as measured at the extremes of the specified analog signal range.

Note 5: Leakage parameters $I_{\text{S(OFF)}}$, $I_{\text{D(OFF)}}$, $I_{\text{D(ON)}}$, and $I_{\text{S(ON)}}$, are 100% tested at the maximum rated hot temperature and guaranteed at $+25^\circ\text{C}$.

Note 6: Off-Isolation Rejection Ratio = $20\log(V_D/V_S)$, V_D = output, V_S = input to off switch.

Note 7: Between any two switches.

Typical Operating Characteristics

Pin Description

PIN	NAME	FUNCTION
1, 16, 9, 8	IN1-IN4	Logic Control Inputs
2, 15, 10, 7	D1-D4	Drain Outputs
3, 14, 11, 6	S1-S4	Source Outputs
4	V-	Negative Supply-Voltage Input
5	GND	Ground
12	V _L	Logic Supply-Voltage Input
13	V+	Positive Supply-Voltage Input—connected to substrate

Applications Information

General Operation

- Switches are open when power is off.
- IN, D, and S should not exceed V+ or V-, even with the power off.
- Switch leakage is from each analog switch terminal to V+ or V-, not to other switch terminals.

Operation with Supply Voltages Other Than ±15V

Using supply voltages other than ±15V will reduce the analog signal range. The DG444/DG445 switches operate with ±4.5V to ±20V bipolar supplies or with a +10V to +30V single supply; connect V- to 0V when operating with a single supply. Also, all device types can operate with unbalanced supplies such as +24V and -5V. V_L must be connected to +5V to be TTL compatible, or to V+ for CMOS-logic level inputs. The *Typical Operating*

Characteristics graphs show typical on-resistance with ±20V, ±15V, ±10V, and ±5V supplies. (Switching times increase by a factor of two or more for operation at ±5V.)

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence V+ on first, followed by V_L, V-, and logic inputs. If power-supply sequencing is not possible, add two small, external signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to 1V below V+ and 1V above V-, but low switch resistance and low leakage characteristics are unaffected. Device operation is unchanged, and the difference between V+ and V- should not exceed +44V.
