

Functional Description

The DM93S62 is a very high speed 9-input parity checker or generator. It is intended primarily for error detection in systems which transmit data in 8-bit bytes, but it can be expanded to any number of data inputs. Both even and odd parity outputs are available to allow maximum flexibility for both parity generation and parity checking. When the device is enabled ($\overline{E} = LOW$), the Even Parity output (PE) is HIGH when an even number of inputs is HIGH, and the Odd Parity output (PO) is HIGH when an odd number of inputs is HIGH. The active LOW Enable (\overline{E}) controls the state of both outputs; when the Enable (\overline{E}) is HIGH, both outputs at very high speeds to synchronize or inhibit the parity data.

The DM93S62 has been designed with two sections using Exclusive-NOR comparison techniques. Eight data inputs

I0–I7 represent one section which will generate a parity bit in 16 ns to 20 ns. The ninth input (I8) bypasses three levels of logic and switches the outputs in 6.0 ns to 9.0 ns. This feature may be used to compensate for delayed arrival of the parity bit, allowing faster system cycle times (Figure 1). The fast I8 input is also useful when more than nine bits are to be checked. The output of one DM93S62 drives the I8 input of a second DM93S62, providing a 17-bit parity check in 29 ns (typ).

When some inputs of the DM93S62 are not used, such as for words of less than nine bits or when using parallel expansion techniques, there is an optimum delay scheme for termination of the unused inputs (see Table 1). In essence, if one of the inputs of any Exclusive-NOR stays HIGH, the delay from the other input to the output is minimized.

Operating Free Air Temperature Range	$0^{\circ}C$ to $+70^{\circ}C$
Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
