

## Voltage Regulator

TLE 4284

### Target Data Sheet

#### Features

- Fixed output voltage regulator 2.5 V, 3.3 V or 5 V
- Adjustable output down to 1.25 V
- 800 mA output current
- 80 dB ripple rejection
- No output capacitor necessary
- Suitable for automotive application
- Short circuit protected
- Overtemperature protected

Type	Ordering Code	Package
▼ TLE 4284 DV	Q67000-A9480	P-TO252-3-1
▼ TLE 4284 DV33	Q67000-A9482	P-TO252-3-1
▼ TLE 4284 DV50	Q67000-A9481	P-TO252-3-1

▼ New device

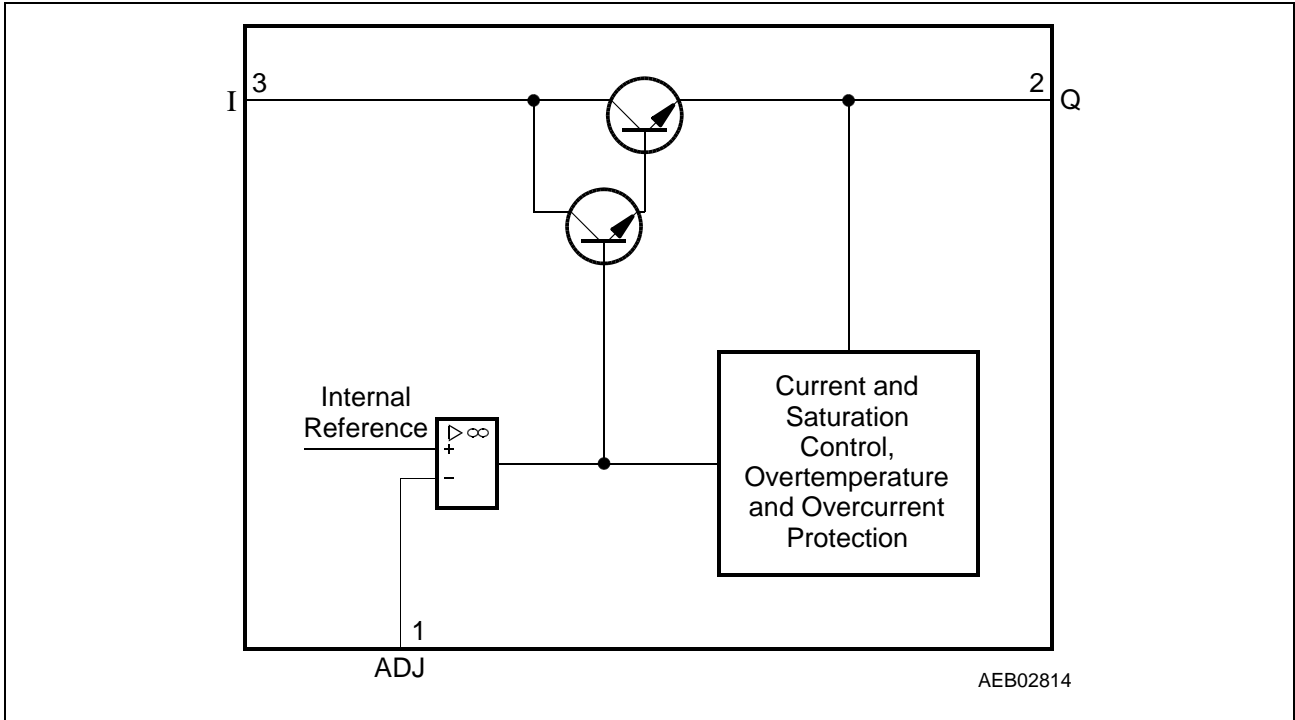

#### Functional Description

The TLE 4284 is a monolithic integrated fixed or adjustable NPN type voltage regulator that can supply loads up to 800 mA. The device is housed in the surface mounted P-TO252-3-1 package (D-Pak). It is designed to supply microprocessor systems under the severe conditions of automotive applications and therefore it is equipped with additional protection against over load, short circuit and overtemperature.

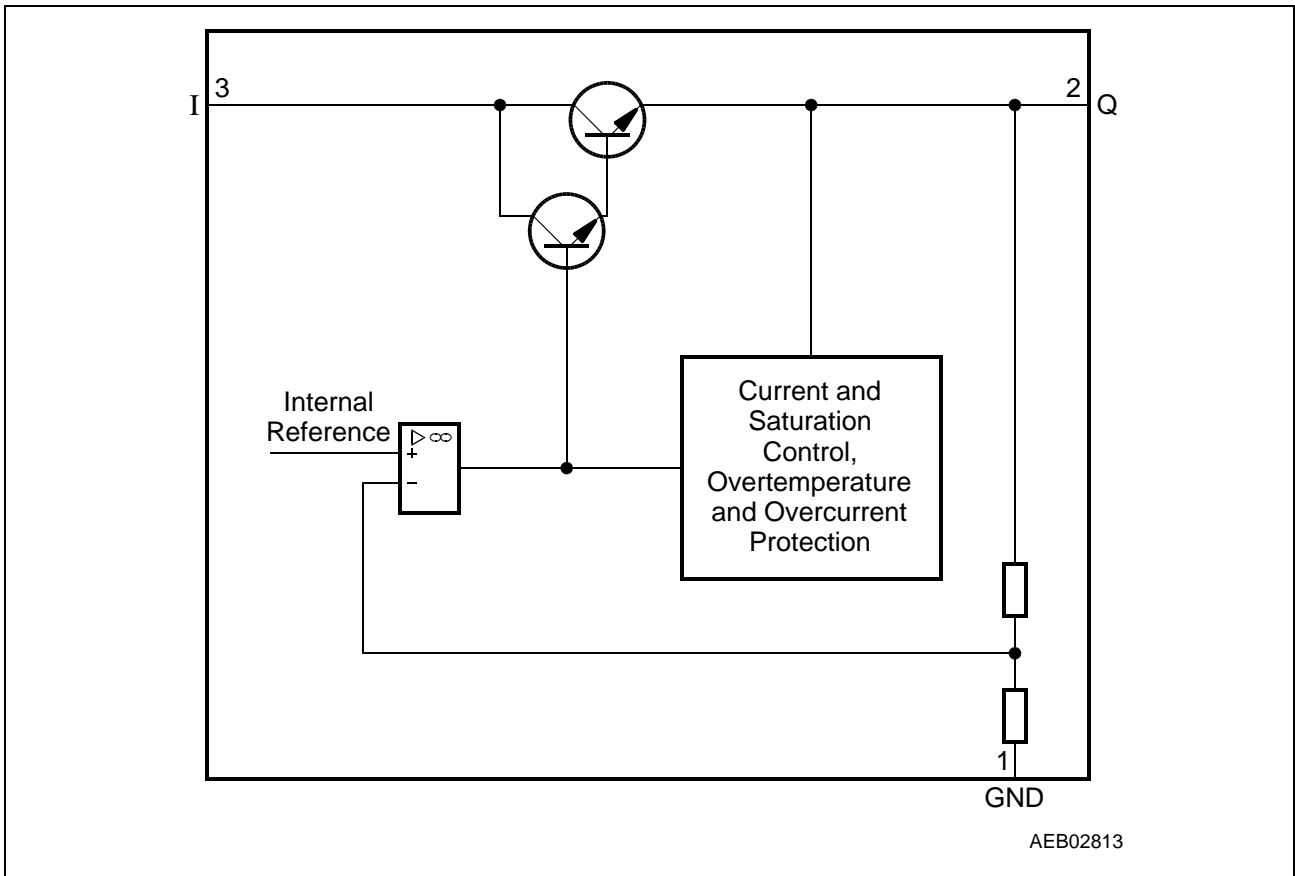

An input voltage  $V_i$  in the range of  $(V_Q + 2 \text{ V}) < V_i < 45 \text{ V}$  is regulated to  $V_Q$ .

The device operates in the temperature range of  $T_j = -40$  to  $150 \text{ }^\circ\text{C}$ .

The device is available for adjustable output voltage as well as in fixed voltage versions for 3.3 V and 5.0 V (2.5 V on demand).

Application Information

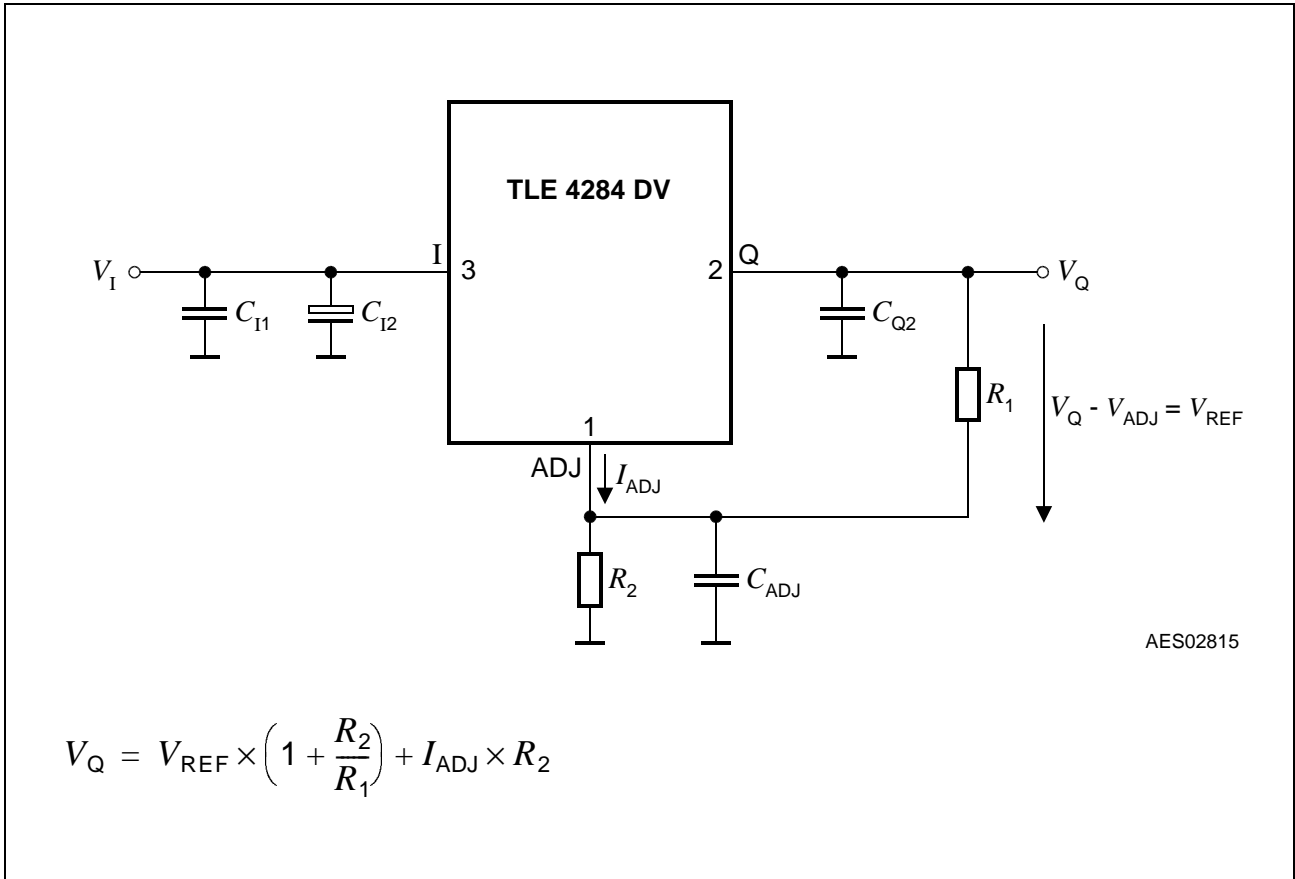

Figure 7 Application Circuit Variable Output Voltage TLE 4284 DV

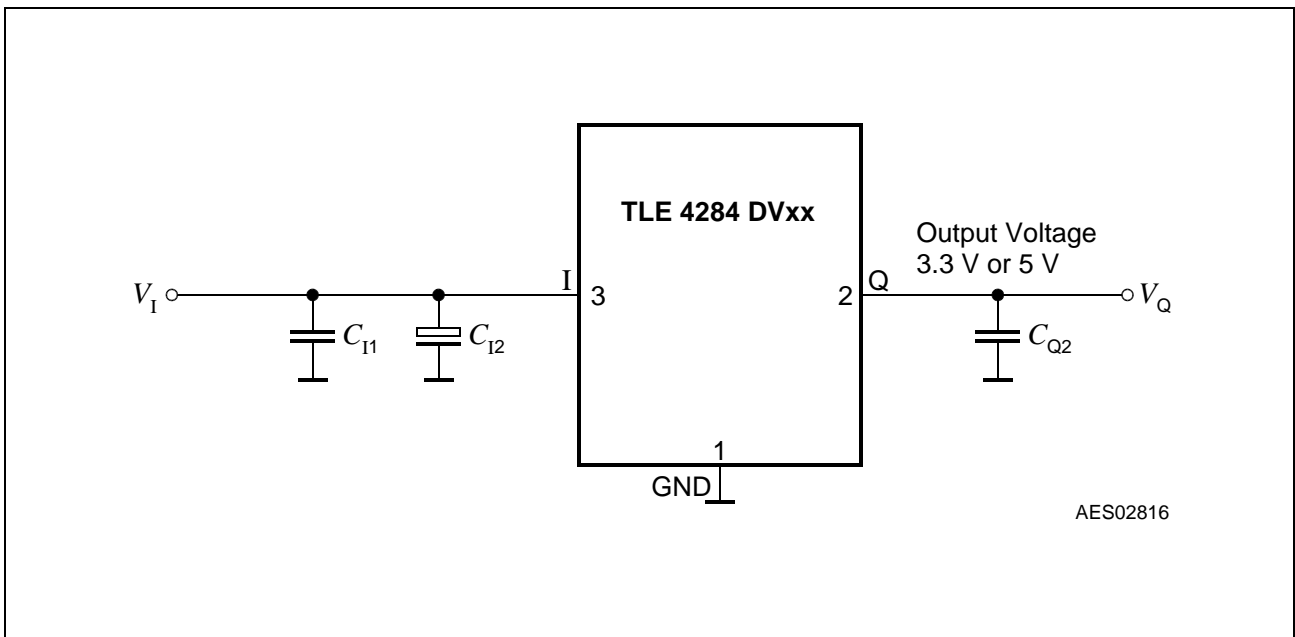

Figure 8 Application Circuit Fixed Output Voltage TLE 4284 DV33, 50

In the fixed voltage TLE 4284 devices the output voltage is divided internally and compared to an internal reference of 1.25 V typical. The regulation loop controls the output voltage to achieve the output voltage of 5 V, 3.3 V or 2.5 V. The variable device compares the voltage difference between the adjust pin ADJ and the output pin Q to the internal reference of 1.25 V; the output voltage is adjusted by an external voltage divider between Q, ADJ and GND (see equation in **Figure 7**).

## Output

The output current limitation is reduced as a function of the input voltage for high input voltages above 25 V.

The TLE 4284 requires no output capacitor for stability, however we recommend to use a ceramic capacitor to filter any noise and improve the transient response.

At the input of the regulator a capacitor is necessary for compensation of line influences. A resistor of approx. 1  $\Omega$  in series with  $C_1$  can damp the LC of the input inductivity and the input capacitor. A serial diode should be used to eliminate negative voltages from the input.

For the variable voltage type an additional decoupling a capacitor  $C_{ADJ}$  at the adjust pin can improve the ripple rejection ratios.
