## TEA6850

IF filter / amplifier / demodulator for  
FM radio receivers

Preliminary specification  
File under Integrated Circuits, IC01

July 1994

# IF filter / amplifier / demodulator for FM radio receivers

## TEA6850

### FEATURES

- Improved dynamic selectivity and sensitivity because of tunable IF filter
- Fully integrated, frequency matched FM demodulator
- High linearity
- Unweighted level detector output
- Soft mute
- MPX output for RDS and diversity
- Internal source selector.

### GENERAL DESCRIPTION

The TEA6850 is a monolithic bipolar integrated circuit for IF filtering, FM demodulation and level detection. Using IF filters tuned by the demodulated signal, dynamic selectivity and sensitivity are improved.

### QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
$V_P$	supply voltage (pin 7)	7	8.5	10	V
$I_P$	supply current (pin 7)	14	17.5	21	mA
DS200	dynamic selectivity for 200 kHz distance (EMF = 700 $\mu$ V; filter bandwidth = 50 kHz)	22	27	–	dB
S/N	signal-to-noise ratio ( $\Delta f = \pm 22.5$ kHz; $f_m = 1$ kHz)	61	67	–	dB
THD	total harmonic distortion ( $\Delta f = \pm 75$ kHz; $f_m = 1$ kHz)	–	0.3	0.5	%
$V_O$	AF output signal at pin 4 (RMS value)	180	200	220	mV
$T_{amb}$	operating ambient temperature	–40	–	+85	°C

## PINNING

SYMBOL	PIN	DESCRIPTION
RDS <sub>OUT</sub>	1	output for RDS
CENABLE	2	chip enable
MPX <sub>IN</sub>	3	external audio frequency input (MPX signal)
MPX	4	audio frequency output (MPX signal)
LVLUNW	5	unweighted level output
MPXSEL	6	source selector for MPX signal
V <sub>P</sub>	7	supply voltage (8.5 V)
GND	8	ground (0 V)
V <sub>GAP</sub>	9	internal reference voltage
V <sub>UT2</sub>	10	reference voltage output
V <sub>UT1</sub>	11	reference voltage output
IFADJ	12	input for IF filter frequency adjustment
BWADJ	13	input for IF filter bandwidth adjustment
IF <sub>IN</sub>	14	IF signal input 1
IF <sub>INi</sub>	15	IF signal input 2
GAINADJ	16	input for mixer gain adjustment
n.c.	17	not connected
CRYSTAL	18	crystal oscillator input
GND	19	oscillator ground
n.c.	20	not connected
OUT300I	21	IF filter output (0°)
OUT300Q	22	IF filter output (90°)
CLIM1I	23	IF limiter feedback 1
CLIM2I	24	IF limiter feedback 2
CLIM3I	25	IF limiter feedback 3
CLIM4I	26	IF limiter feedback 4
CLIM1Q	27	IF limiter feedback 5
CLIM2Q	28	IF limiter feedback 6
CLIM3Q	29	IF limiter feedback 7
CLIM4Q	30	IF limiter feedback 8
LVLADJ	31	input for level adjustment
LVLWEI	32	weighted level output
IHP60	33	input for high-pass –3 dB adjustment
CHPMUTE	34	output of rectified high-pass signal
CMUTE	35	mute input
DEMOLOOP1	36	demodulator output 1
DEMOLOOP2	37	demodulator output 2
COP2	38	MPX correction output 2
CON2	39	MPX correction input 2
COO1	40	MPX correction output 1

IF filter / amplifier / demodulator for FM  
radio receivers

TEA6850

SYMBOL	PIN	DESCRIPTION
CON1	41	MPX correction input 1
IFLOOP1	42	IF loop filter output 1
IFLOOP2	43	IF loop filter output 2
IFLOOP3	44	IF loop filter output 3

## IF filter / amplifier / demodulator for FM radio receivers

TEA6850

### FUNCTIONAL DESCRIPTION

The first mixer stage at the input of the circuit is for mixing the 10.7 MHz IF signal to 300 kHz. The IF filter has a resonance frequency of 300 kHz (adjustable), tunable from 50 kHz to 500 kHz, and a bandwidth of about 20 kHz to 80 kHz tunable. Static filter response see Fig.5. The limiter has a gain of approximately 90 dB, which is virtually independent from temperature change. The demodulator is frequency matched with the IF filter.

### LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
$V_P$	supply voltage	-0.3	+12	V
$I_P$	supply current	-	21	mA
$T_{stg}$	storage temperature	-55	+125	°C
$T_{amb}$	operating ambient temperature	-40	+85	°C
$P_{tot}$	total power dissipation	-	252	mW
$V_{ESD}$	electrostatic handling for all pins (note 1)	-	±300	V

#### Note to the Limiting Values

1. Charge device model class B: equivalent to discharging a 200 pF capacitor through a 0  $\Omega$  series resistor.

### THERMAL RESISTANCE

SYMBOL	PARAMETER	THERMAL RESISTANCE
$R_{th\ j-a}$	from junction to ambient in free air	65 K/W

### APPENDIX

#### Alignment procedure for the test circuit (see Fig.4)

1. Connect a spectrum analyser to pin 21 or pin 22. Set centre frequency to 300 kHz and frequency span from 200 kHz to 400 kHz.
2. Set frequency of RF-generator to 10.7 MHz, EMF-level to 4 mV RMS, modulation frequency to 1 kHz and frequency deviation to 75 kHz.
3. Turn poti P7 in the mid position. Align centre frequency of the tunable IF-filter with poti P5. The alignment is correct, if the spectrum measured at pin 21 is symmetric.
4. Set frequency deviation of RF-generator to zero (EMF = 4 mV RMS). Align the downconverter gain with poti P1. The alignment is correct, if the level at pin 21 is 2 mV RMS.
5. Short pin 36 and pin 37. Set frequency of RF-generator to 10.6 MHz respectively 10.8 MHz (EMF = 4 mV RMS,  $\Delta f = 0$ ). Align bandwidth of the tunable IF-filter with poti P7. The alignment is correct, if the level measured at 200 kHz respectively 400 kHz is 21 dB below the maximum. Remove the short.
6. Set frequency of the RF-generator to 10.7 MHz, EMF-level to 20 mV RMS, modulation frequency to 1 kHz and frequency deviation to 22.5 kHz. Measure level of the 1 kHz signal at pin 4. Set the EMF-level to 200  $\mu$ V. Align start of mute ( $\alpha - 3$  dB) with poti P2.
7. Set EMF-level back to 20 mV RMS and vary the modulation frequency. Align MPX output voltage ripple (see  $\Delta V_O$  in the AC CHARACTERISTICS) with poti P6.

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

#### Reflow soldering

Reflow soldering techniques are suitable for all QFP packages.

The choice of heating method may be influenced by larger plastic QFP packages (44 leads, or more). If infrared or vapour phase heating is used and the large packages are not absolutely dry (less than 0.1% moisture content by weight), vaporization of the small amount of moisture in them can cause cracking of the plastic body. For more information, refer to the Drypack chapter in our *"Quality Reference Handbook"* (order code 9397 750 00192).

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

#### Wave soldering

Wave soldering is **not** recommended for QFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

**If wave soldering cannot be avoided, the following conditions must be observed:**

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.**

**Even with these conditions, do not consider wave soldering the following packages: QFP52 (SOT379-1), QFP100 (SOT317-1), QFP100 (SOT317-2), QFP100 (SOT382-1) or QFP160 (SOT322-1).**

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
