

Low-Voltage, CMOS Analog Multiplexers/Switches

General Description

The MAX4581L/MAX4582L/MAX4583L are low-voltage, CMOS analog ICs configured as an 8-channel multiplexer (MAX4581L), two 4-channel multiplexers (MAX4582L), and three single-pole/double-throw (SPDT) switches (MAX4583L).

These CMOS devices operate with a +2V to +12V single supply. Each switch can handle Rail-to-Rail® analog signals. Off-leakage current is only 2nA at +25°C.

All digital inputs have 0.8V to 2.0V logic thresholds to ensure TTL/CMOS-logic compatibility when using a +12V supply.

Low-Voltage, CMOS Analog Multiplexers/Switches

Detailed Description

The MAX4581L/MAX4582L/MAX4583L are low-voltage, CMOS analog ICs that operate from a single supply of +2V to +12V. The MAX4581L is configured as an 8-channel multiplexer, the MAX4582L as two 4-channel multiplexers, and the MAX4583L as three single-pole/double-throw (SPDT) switches. These devices can handle rail-to-rail analog signals with only 2nA of off-leakage current at +25°C.

The MAX4581L/MAX4582L/MAX4583L are TTL/CMOS-logic compatible with 0.8V to 2.0V logic thresholds for all digital inputs when operating from a +12V supply.

Applications Information

Power-Supply Considerations

The MAX4581L/MAX4582L/MAX4583Ls' construction is typical of most CMOS analog switches. The supply input, V_{CC}, is used to power the internal CMOS switches and sets the limit of the analog voltage on any switch. Reverse ESD protection diodes are internally connected between each analog signal pin and both V_{CC} and GND. If any analog signal exceeds V_{CC} or goes below GND, one of these diodes conducts. During normal operation, these reverse-biased ESD diodes leak, causing the only current drawn from V_{CC} or GND. Virtually all the analog leakage current comes from the ESD diodes. Although the ESD diodes on a given signal pin are identical, and therefore fairly well balanced, they are reverse biased differently by either

V_{CC} or GND and the analog signal. This means that leakage varies as the analog signal varies. The difference in the two diodes' leakage to V_{CC} and GND constitutes the analog signal-path leakage current. Because there is no connection between the analog signal paths and GND, all analog leakage current flows between each pin and one of the supply terminals, not to the other switch terminal. Because of this, both sides of a given switch can show leakage currents of either the same or opposite polarity.

V_{CC} and GND power the internal logic and logic-level translators, and set both the input and output logic limits. The logic-level translators convert the logic levels into switched V_{CC} and GND signals to drive the gates of the analog switches. This drive signal is the only connection between the logic supplies (and signals) and the analog supplies. The logic-level thresholds are TTL/CMOS compatible when V_{CC} is +12V.

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence V_{CC} first, followed by the logic inputs and analog signals.

Pin Nomenclature

The MAX4581L/MAX4582L/MAX4583L are pin compatible with the industry-standard 74HC4051/74HC4052/74HC4053 and the MAX4051/MAX4052/MAX4053.
