

MAXIM

CMOS 10-Bit A/D Converter with Track-and-Hold

MAX177

General Description

The MAX177 is a complete CMOS sampling 10-bit analog-to-digital converter (ADC) that combines an on-chip track-and-hold and voltage reference along with high conversion speed and low power consumption. A conversion time of 8.33 μ s includes settling time for the track-and-hold. An internal buried zener reference provides low drift with low noise.

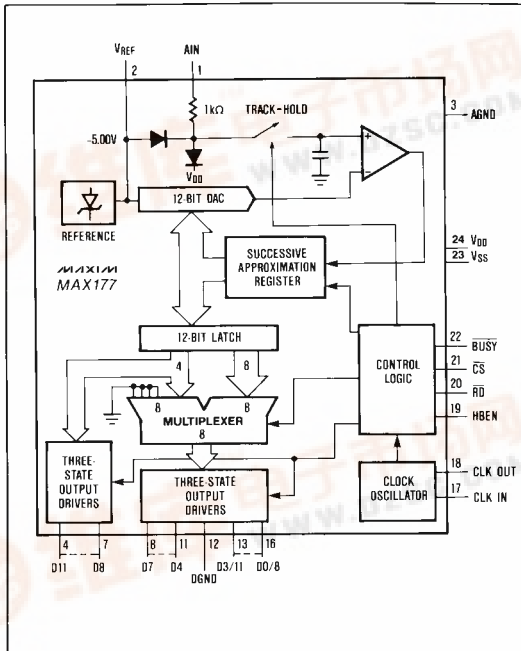

The MAX177 accepts -2.5V to +2.5V inputs. External components are limited to only decoupling capacitors for the power supply and reference voltages. On-chip clock circuitry can either be driven from an external clock source or a crystal.

The MAX177 employs a standard microprocessor interface. Three-state data outputs can be configured for 8- or 12-bit data buses. Data access and bus release timing specs are compatible with most popular microprocessors without resorting to wait states.

Applications

- Digital Signal Processing (DSP)
- Audio and Telecom Processing
- High Accuracy Process Control
- High Speed Data Acquisition

Features

- ◆ 12-Bit Resolution and 10-Bit Linearity
- ◆ 8.33 μ s Conversion Time
- ◆ Internal Analog Track-Hold
- ◆ 6MHz Full Power Bandwidth
- ◆ On-Chip ± 40 ppm/ $^{\circ}$ C Voltage Reference
- ◆ High Input Resistance (500M Ω)
- ◆ 100ns Data Access Time
- ◆ 180mW (Max) Power Consumption
- ◆ 24 Lead Narrow DIP and Wide SO Packages

		Lead Temperature (Soldering 10 seconds)	+300°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: Typical change over temp is $\pm 1mV$.

Note 2: Ideal last code transition = FS - 1.8mV LSB, adjusted for offset.

Note 3: Full Scale Tempco = dFS/dT , where dFS is full scale change from $T_A = 25^\circ C$ to T_{MIN} or T_{MAX} .

Note 4: Guaranteed by design, not subject to test.

Note 5: V_{REF} Tempco = dV_{REF}/dT , where dV_{REF} is reference voltage change from $T_A = 25^\circ C$ to T_{MIN} or T_{MAX} .

Note 6: All input control signals are specified with $t_r = t_f = 5ns$ (10% to 90% of +5V) and timed from a voltage level of +1.6V.

Note 7: This specification is 100% production tested.

Note 8: t_3 and t_6 are measured with the load circuits of Figure 1 and defined as the time required for an output to cross 0.8V or 2.4V.

Note 9: t_7 is defined as the time required for the data line to change 0.5V when loaded with the circuits of Figure 2.
