(CS=OE=V_{IL}, WE=V_{IH})

TIMING WAVEFORM OF READ CYCLE(2) ($\overline{WE}=V_{IH}$)

NOTES (READ CYCLE)

1. tHZ and toHZ are defined as the time at which the outputs achieve the open circuit condition and are referenced to the V_{OH} or V_{OL} .
2. At any given temperature and voltage condition tHZ(max) is less than tLZ(min) both for a given device and from device to device.
3. \overline{WE} is high for read cycle.
4. Address valid prior to or coincident with \overline{CS} transition Low.

NOTES (WRITE CYCLE)

1. A write occurs during the overlap(t_{WP}) of a low \overline{CS} and low \overline{WE} . A write begins at the latest transition among \overline{CS} going low and \overline{WE} going low : A write end at the earliest transition among \overline{CS} going high and \overline{WE} going high, t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of \overline{CS} going low to end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change.
5. If $\overline{OE}, \overline{WE}$ are in the read mode during this period, the I/O pins are in the outputs Low-Z state. Inputs of opposite phase of the output must not be applied because bus contention can occur.
6. If \overline{CS} goes low simultaneously with \overline{WE} going low or after \overline{WE} going low, the outputs remain high impedance state.
7. Dout is the same phase of the latest written data in this write cycle
8. Dout is the read data of new address
