## 50MHz，Selectable，Four Channel Video Operational Amplifier

The HA－2444 is a channel－selectable video op amp consisting of four differential inputs，a single－ended output， and digital control circuitry allowing two digital inputs to activate one of the four differential inputs．The HA－2444 also includes a high impedance output state allowing the outputs of multiple HA－2444s to be wire－OR＇d．Functionally，the HA－2444 is equivalent to four wideband video op amps and a wideband multiplexer．

Unlike similar competitor devices，the HA－2444 is not restricted to multiplexing．Any op amp configuration can be used with any of the inputs．Signal amplification，addition， integration，and more can be put under digital control with broadcast quality performance．

The key video parameters of the HA－2444 have been optimized without compromising DC performance．Gain Flatness to 10 MHz is only 0.1 dB ．Differential gain and phase are typically $0.03 \%$ and 0.03 degrees，respectively．Laser trimming allows offset voltages in the 4.0 mV range and a unique common current source design assures minimal channel－to－channel mismatch，while maintaining 60 dB of crosstalk rejection at 5 MHz ．Open loop gain of 76 dB and low input offset and bias currents enhance the performance of this versatile device．

For information about military grade devices，please refer to the HA－2444／883 data sheet．
