# HA11560FP/T

## VCR/VDP RF Modulator

# HITACHI

Rev. 1  
Dec. 1993

This chip is designed for application as an RF modulator in VCRs and VDPs. A new type RF oscillator provides superior harmonic characteristics.

### Functions

- Video modulator
- RF carrier oscillator
- White clip
- Channel switch
- Audio carrier converter
- ANT switch driver
- Carrier off switch

### Features

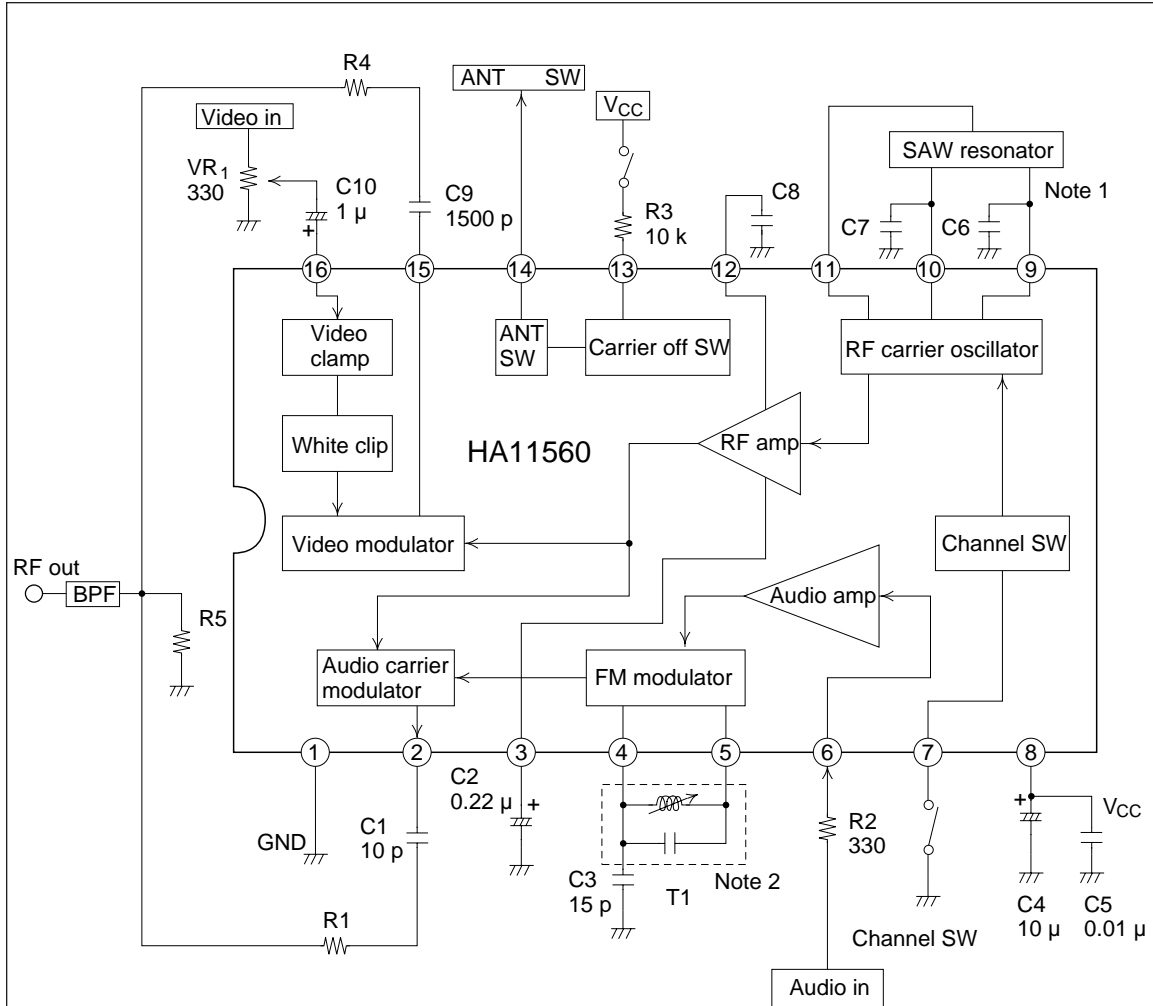

- Superior harmonic characteristics allow easy pattern design.
- Sharp white chip characteristics with no distortion
- The use of miniature surface mount packaging allows substrate miniaturization (TSOP).

### Ordering Information

Type No.	Package
HA11560FP	16 pin plastic SOP
HA11560T	16pin plastic TSOP

# HA11560FP/T

## Block Diagram

### External Components (Notes 1 and 2)

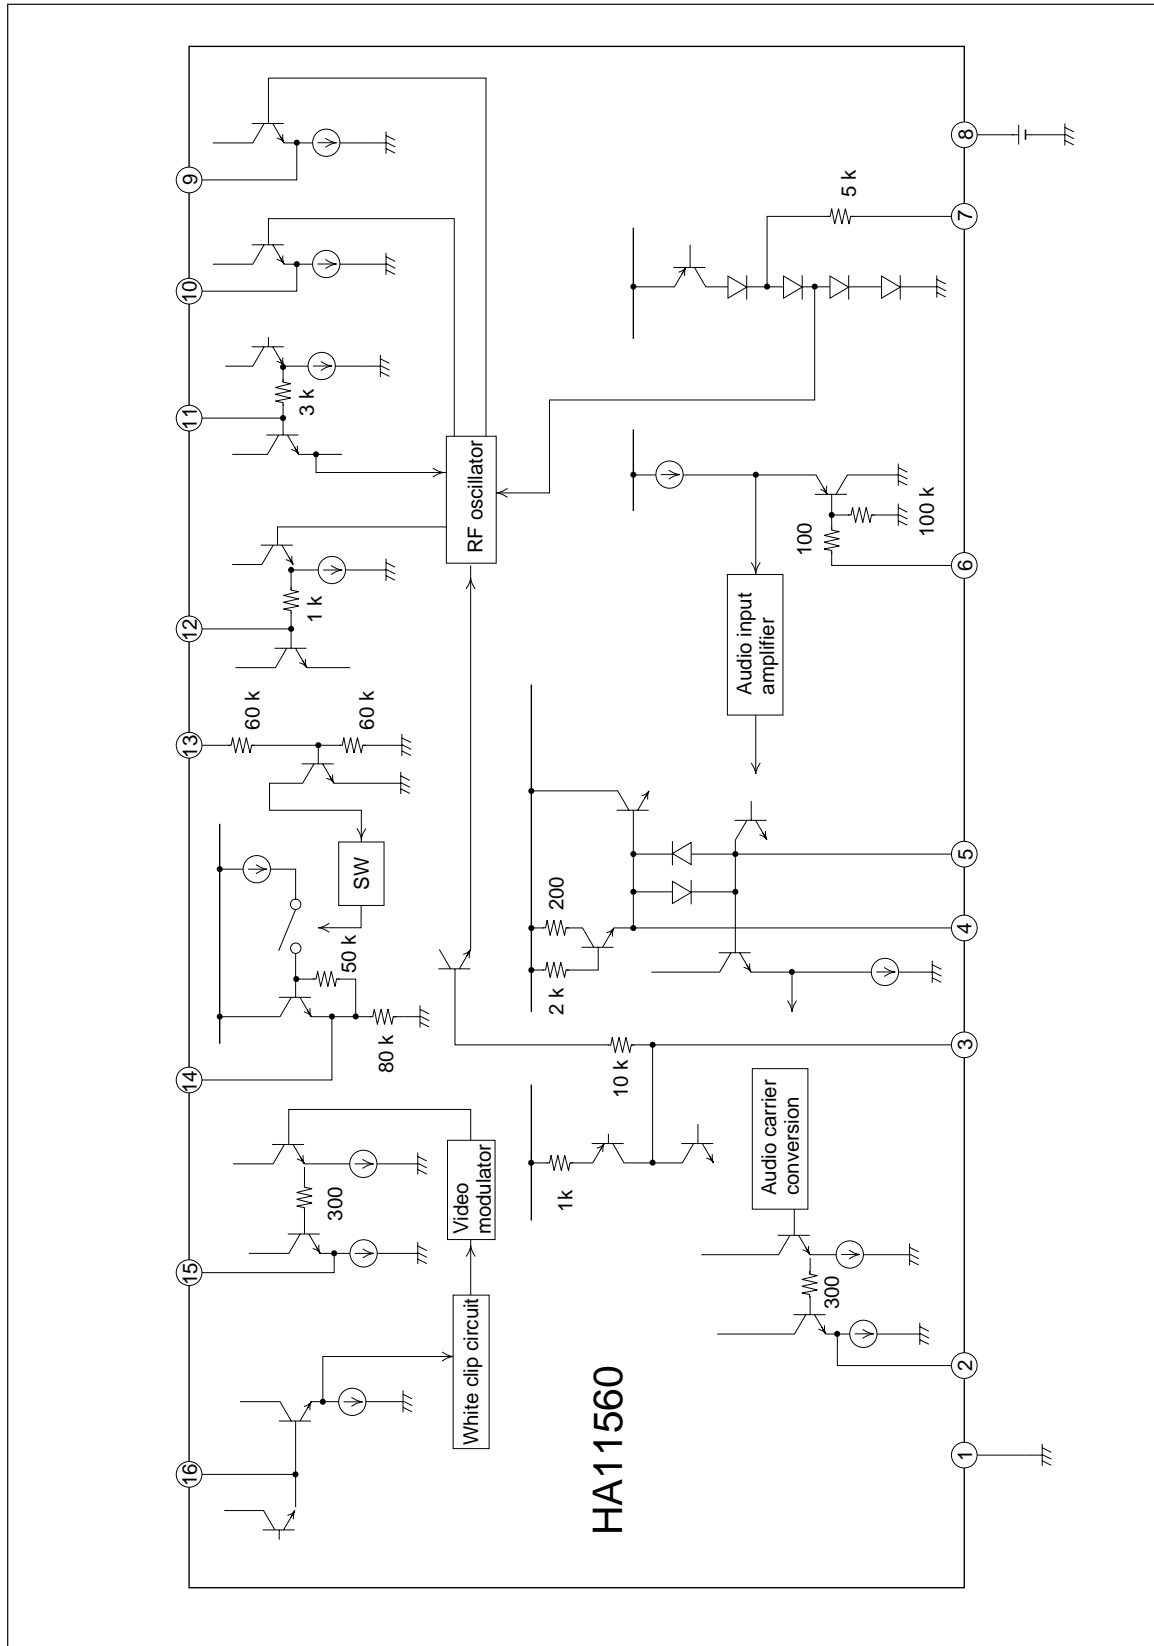

No.	Component	Model	Manufacturer	Remarks
1	SAW resonator	KAR91CS (Japanese specifications)	Kyocera, Inc.	KAR61CT (U. S. specifications)
2	4.5-MHz tank coil	291ACS-4060Z 62-pF tuning capacitor on-chip 369SN-1458Z External tuning capacitor	Toko, Inc.	Use 369SN-1458Z for greater tuning capacitance. Note this also decreases audio modulation factor.

**Pin Functions**

<b>Pin No.</b>	<b>Symbol</b>	<b>Function</b>	<b>Voltage Pin</b>	<b>Remarks</b>
1	GND	GND	GND	
2	AUDIO RF OUT	Audio RF signal output pin	3.2 V	Output Level = 85 dB $\mu$ V
3	RF OSCILLATOR BIAS	RF oscillator voltage control pin	(3.1 V)	RF oscillator active state
4	FM MOD COIL	FM modulator tank coil connector pin	4.1 V	Reference voltage pin
5	FM MOD COIL	FM modulator tank coil connector pin	4.1 V	Swing Level $\approx$ 1.0 Vp-p
6	AUDIO IN	Audio signal input pin	0 V	
7	CHANNEL SW	RF oscillation frequency channel switch	2.8 V (when open)	Pin 9 output (when open)
8	V <sub>CC</sub>	V <sub>CC</sub>	5V	
9	SAW.R LOW CHANNEL	SAW resonator connector pin (low ch)	3.7 V	Swing Level $\approx$ 80 mVp-p
10	SAW.R HIGH CHANNEL	SAW resonator connector pin (high ch)	3.7 V	
11	SAW.R COMMON	SAW resonator connector pin (common)	3.2 V	
12	DP Adj.	Video differential phase and harmonic level adjust pin	2.6 V	Good oscillating stability smaller capacitance value
13	CARRIER OFF SW	RF switch driver and RF oscillator switch pin	0 to 5 V	0 V (when open)
14	ANT SW DRIVER	RF switch driver drive pin	0 to 3.6 V	Maximum output current = 30 mA
15	VIDEO RF OUT	Video RF signal output pin	3.1 V	Note: Output level = 91.5 dB $\mu$ V
16	VIDEO IN	Video signal input pin	1.6 V	

<b>Note:</b>	<b>Channel</b>	<b>Carrier frequency</b>
	JPN1	91.25 MHz
	JPN2	97.25 MHz
	US3	61.25 MHz
	US4	67.25 MHz

# HA11560FP/T

**Block Operation Descriptions**

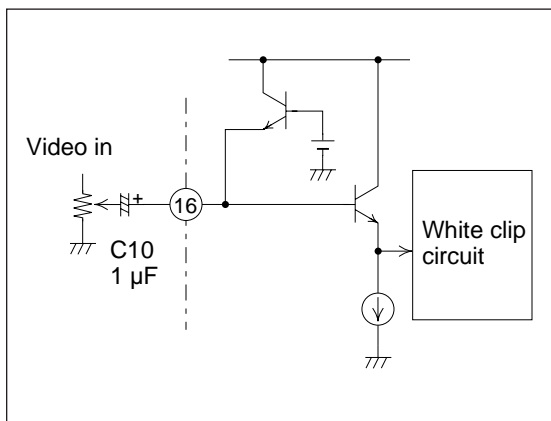

The following describes the operation of each block and external circuits.

**Video Clamp**

The video clamp circuit employs a sync peak value clamp. Input impedance is at a level of approximately 30 kΩ to reduce compression of the sync pulse. Note that sag is generated in the sync pulse when a capacitor of 0.47 μF or lower is used for C10 at pin 16.

**White Clip Circuit**

The white clip level is set to 92.5%. A circuit that produces a sharp white clip is used in order to produce high linearity characteristics for the video. Increasing the white clip frequency characteristic by another 5 MHz eliminates video carrier cutoff by the chroma signal and prevents deterioration of audio buzz characteristics.

## RF Oscillator/Channel Switch

A new type RF oscillator is employed to reduce RF harmonics to a level that is dramatically lower than previous available Hitachi products.

Note that using a capacitor lower than  $0.22 \mu\text{F}$  at pin 3 causes an increase in sync pulse sag.

The input resistance at pin 11, which is the oscillator input pin, is  $3 \text{ k}\Omega$ . Pins 9 and 10 are oscillator output pins, and are NPN transistor emitter-follower types.

The oscillator frequency is selectable by switching the pin 7 channel switch between SAW resonator low channel and high channel. When the channel switch is open, oscillation output is performed from pin 9, while grounding the switch causes output from pin 10. The switching voltage of the channel switch is approximately 2.1 V. When the channel switch is grounded, a current of  $30 \mu\text{A}$  flows through pin 7, which is sufficient to drive an electronic switch.

## Antenna Switch

The antenna switch links the drive circuit that switches the RF switch on and off with the chip's

RF oscillator on/off operation.

Opening the switch at pin 13 stops oscillation of the RF oscillator and the antenna switch drive output at pin 14 becomes 0 V. The audio system is operating in this state, which acts to suppress generation of popping noise in the audio as the antenna switches between on and off.

When pin 13 is connected to  $V_{CC}$  by a closed switch, the RF oscillator is operational and the antenna switch drive output DC level at pin 14 is high.

Pin 13 should be connected to  $V_{CC}$  when the antenna switch is not used. A maximum current of 30 mA can be obtained from the antenna switch driver.

Be sure to connect  $10 \text{ k}\Omega$  for R3 at pin 13 when the antenna switch is being used. R2 is used as protective resistance when the antenna switch power supply is switched on before the chip power supply.

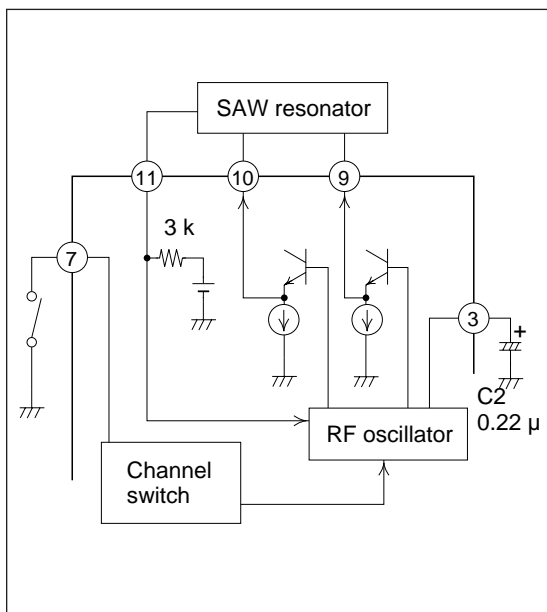

Figure 3 RF Oscillator Interface Circuit

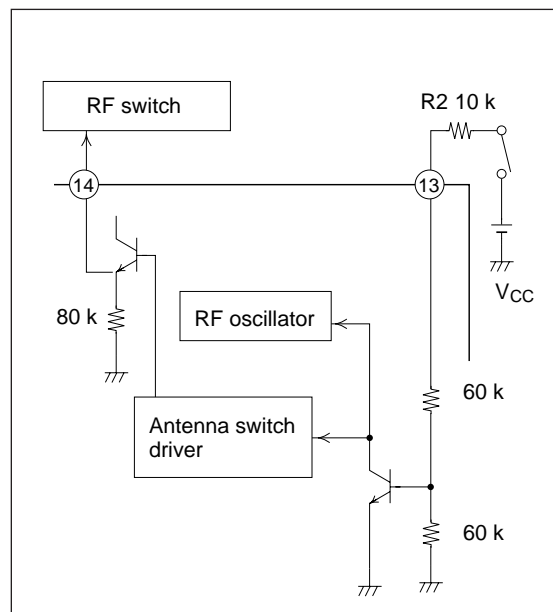

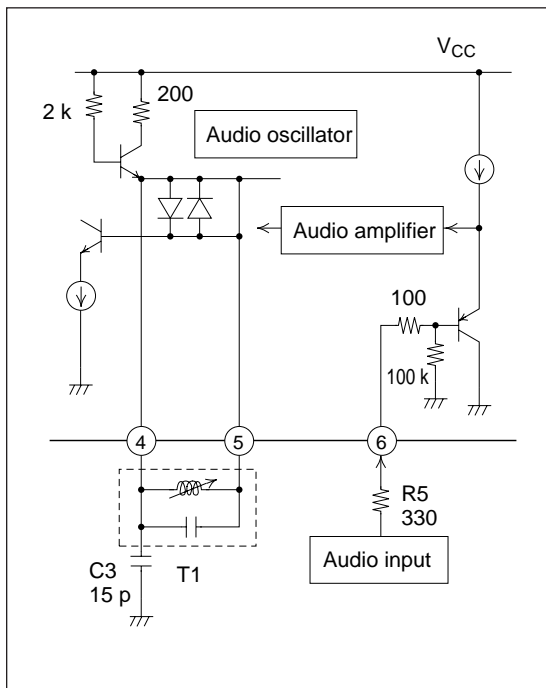

Figure 4 Antenna Switch Interface Circuit

**Audio Modulator**

Pins 4 and 5 make up the reference oscillator for the 4.5 MHz audio modulator. Pin 4 is the oscillator's reference bias source. A 15 pF capacitor must be used for C3 at pin 4 to cut the ac signal. The oscillation frequency is determined by an external tank circuit.

An external coupling capacitor is not required when pin 6, which is the audio input pin, is almost equal to ground potential and the audio input signal dc level is ground potential. The ground potential of the input pin results in a circuit configuration that reduces pin 6 voltage fluctuations and suppresses popping noise.
