Quad. Multiplexers/Latches

The HD100155 contains four transparent latches, each of which can accept and store data from two sources. When both Enable (\overline{E}_n) inputs are low, the data that appears at an outputs is controlled by the Select (S_n) inputs, as shown in the operating mode table. In addition to routing data from either D_0 or D_1 , the Select inputs can force the outputs low for the case where the latch is transparent (both Enables are low) and can steer a

high signal from either D_0 or D_1 to an output. The Select inputs can be tied together for applications requiring only that data be steered from either D_0 or D_1 .

A positive-going signal on either Enable input latches the outputs. A high signal on the Master Reset (MS) input overrides all the other inputs and forces the Q outputs low.

OPERATING MODE TABLE

CONTROLS				OUTPUT
