## High-Speed, CMOS, Quad, SPST Analog Switch

HI-201HS

### General Description

Maxim's HI-201HS is a monolithic, CMOS, quad, single-pole-single-throw (SPST), high-speed analog switch featuring fast switching times ( $t_{OFF}$ ,  $t_{ON} \leq 50\text{ns}$ ) and low on resistance ( $50\Omega$  max). It is pin compatible with the industry-standard DG201A.

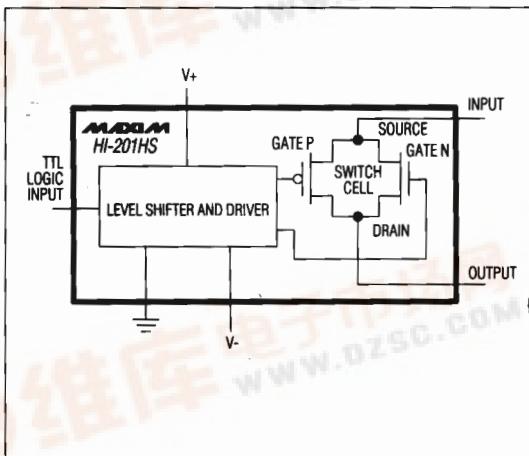

Maxim's new high-voltage silicon-gate technology increases the maximum supply-voltage rating to 44V. This improvement allows continuous operation with  $\pm 20\text{V}$  supplies, which is not permitted with the original manufacturer's devices. Maxim's HI-201HS operates from dual supplies ranging from  $\pm 5\text{V}$  to  $\pm 20\text{V}$ , or from single supplies from +12V to +20V. Logic levels are TTL-/CMOS-compatible with single or dual supplies within these ranges.

Maxim's HI-201HS is guaranteed not to latch up if power supplies are disconnected while the analog-switch inputs are present, provided the switch continuous-current ratings are not exceeded. When powered up, the HI-201HS will switch analog signals up to the power-supply rails.

### Applications

- Automatic Test Equipment (ATE)
- Heads-Up Displays
- Communication Systems
- Sample-and-Hold Circuits
- Military
- Integrator Reset Circuits

### Functional Diagram

- ### Features
- Guaranteed Single-Supply Operation: +12V to +20V
  - Guaranteed Dual Supplies:  $\pm 5\text{V}$  to  $\pm 20\text{V}$
  - Fast Switching Times:
    - $t_{ON} = 30\text{ns}$
    - $t_{OFF} = 40\text{ns}$
  - Low,  $50\Omega$  Max On Resistance
  - TTL-/CMOS-Compatible
  - 44V Max Supply Rating

**Note 1:** Signals on  $S_x$ ,  $D_x$ , or  $I_{Nx}$  exceeding  $V_+$  or  $V_-$  are clamped by internal diodes. Limit forward current to maximum current ratings.

**Note 2:** All leads soldered or welded to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### Protecting Against Fault Conditions

Fault conditions occur when power supplies are turned off and input signals are still present, or when overvoltages occur at the inputs during normal operation. In either case, source-to-body diodes can be forward biased and conduct current from the signal source. If this current must be kept at low ( $\mu$ A) levels, we recommend adding external protection diodes (Figure 1).

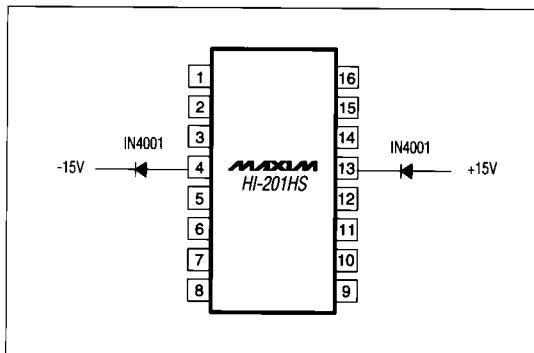

Figure 1. Protection Against Fault Conditions

To provide protection for overvoltages up to 20V above the supplies, place a 1N4001 or 1N914 type diode in series with the positive and negative supplies, as shown in Figure 1. Adding these diodes will reduce the analog-signal range to 1V below the positive supply and 1V above the negative supply.
