

IF Modulator/Demodulator IC

Technical Data

HPMX-5002

Features

- Use with HPMX-5001 Up/Down Converter Chip for DECT Telephone Applications
- 2.7–5.5 V Single Supply Voltage
- >75 dB RSSI Range
- Internal Data Slicer
- On-chip LO Generation, Including VCO, Prescalers and Phase/Frequency Detector
- Flexible Chip Biasing, Including Standby Mode
- Supports Reference Crystal Frequencies of 9, 12, and 16 Times the DECT Bit Rate (1.152 MHz)
- IF Input Frequency Range up to 250 MHz
- TQFP-48 Surface Mount Package

Plastic TQFP-48 Package

Pin Configuration

Description

The Hewlett-Packard HPMX-5002 IF Modulator/Demodulator provides all of the active components necessary for the demodulation of a downconverted DECT signal. Designed specifically for DECT, the HPMX-5002 contains a down-conversion mixer (to a 2nd IF), limiting amplifier chain, discriminator/data slicer, lock detector, and RSSI circuits. The LO2 generation is also included on-chip, via a VCO, dividers, and phase/frequency detector. The divide ratios are programmable to support reference frequencies of either 9, 12, or 16 times the DECT bit rate of 1.152 MHz allowing the use of common, low cost crystals.

The LO2 VCO can also be utilized in transmit mode by directly modulating the external VCO tank. An AGC loop in the buffered VCO output suppresses harmonics and reduces signal level variability.

The HPMX-5002 is designed to meet the size and power demands of portable applications. Battery cell count and cost are reduced due to the 2.7 V minimum supply voltage. The TQFP-48 package, combined with the high level of integration, means smaller footprints and fewer components. Flexible chip biasing takes full advantage of the power savings inherent in time-duplexed DECT.

Applications

- DECT, Unlicensed PCS and ISM Band Handsets, Basestations and Wireless LANs

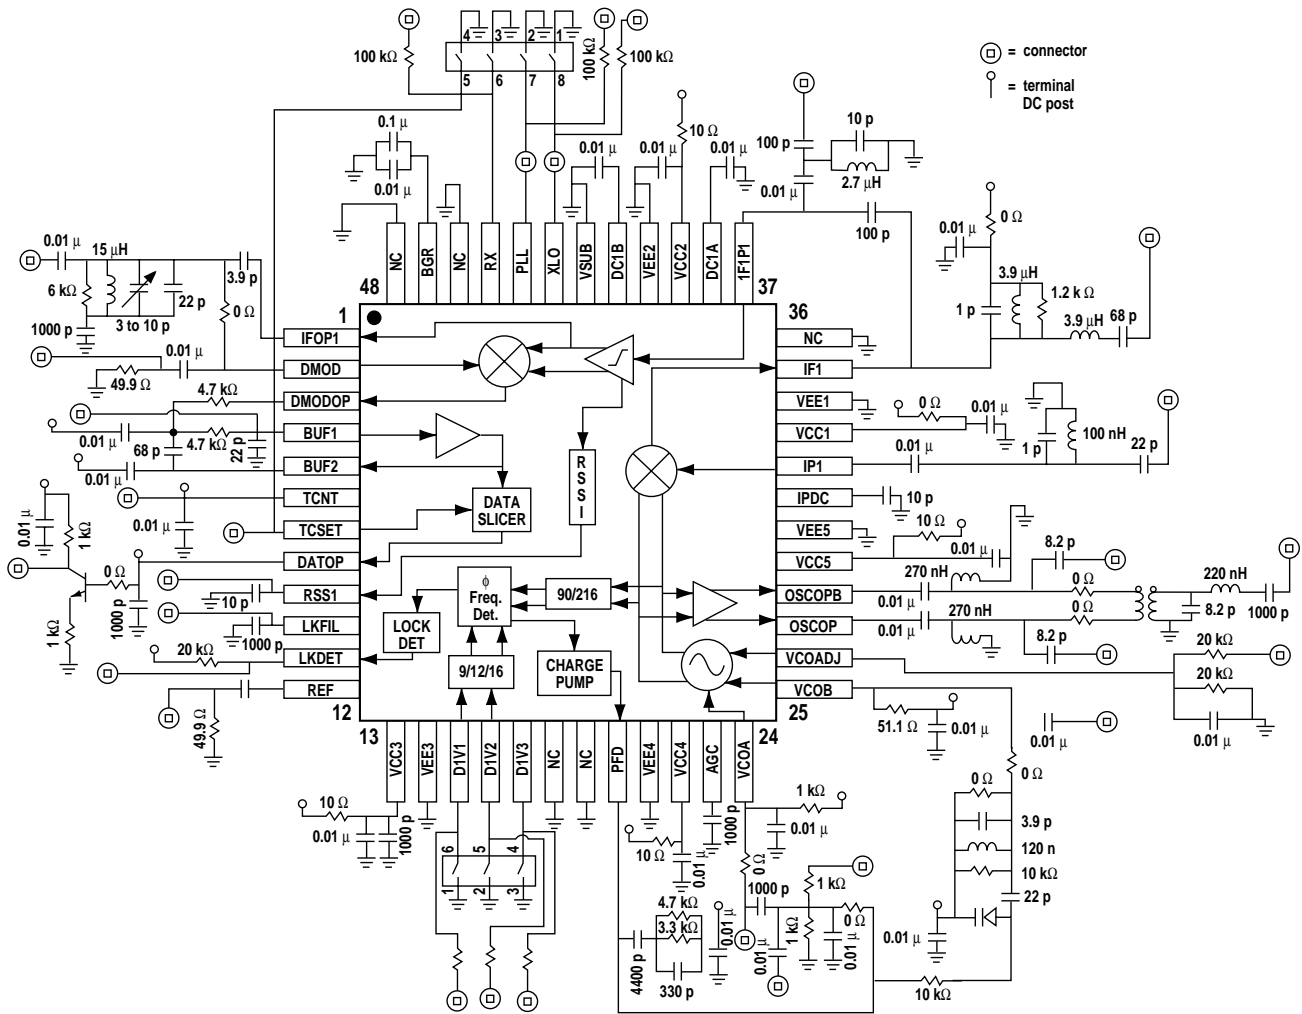

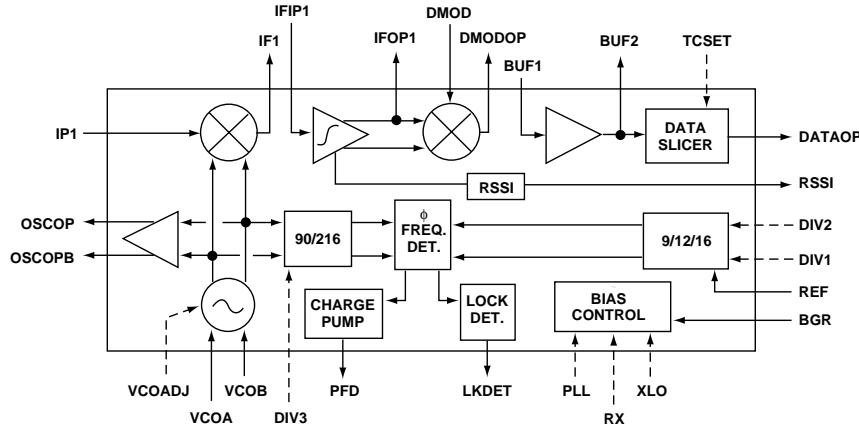

Figure 1. HPMX-5002 Test Board Schematic Diagram.

HPMX-5002 Functional Block Diagram

HPMX-5002 Absolute Maximum Ratings^[1]

Symbol	Parameter	Units	Min.	Max.
	V _{CC} Supply Voltage	V	-0.2	7.5
	Voltage at any Pin ^[4]	V	-0.2	V _{CC} + 0.2
P _{diss}	Power Dissipation ^[2,3]	mW		200
	Junction Temperature	°C		+110
T _{STG}	Storage Temperature	°C	-55	+125

Thermal Resistance^{[2]:}

$$\theta_{jc} = 80^{\circ}\text{C/W}$$

Notes:

1. Operation of this device in excess of any of these parameters may cause permanent damage.
2. T_{case} = 25°C
3. Derate at 10 mW/°C for T_{case} > 90°C
4. Except CMOS logic inputs, see Summary Characterization Information Table.

HPMX-5002 Guaranteed Electrical Specifications

Unless otherwise noted, all parameters are guaranteed under the following conditions: 2.7 V < V_{CC} < 5.5 V.

Test results are based upon use of networks shown in test diagram (see Figure 1). f_{in} = 110.592 MHz.

Typical values are for V_{CCX} = 3.0 V, T_A = 25°C.

Symbol	Parameters and Test Conditions	Units	Min.	Typ.	Max.
I _{ccx}	Total V _{ccx} supply current RX mode (PLL locked)	mA		21	27
	PLL mode	mA		16	20
	TX "flywheel" mode	mA		9	11.5
	Standby mode	μA			100
	Charge pump current high current mode	μA	400	550	1000
	Charge pump current low current mode	μA	30	50	100
GIF1	Mixer power gain from input matched to 50 Ω IP1 to IF1, external load impedance of 600 Ω	dB	5	8	
V _{DATOP}	Data slicer output level Logic '0'	V			0.3
V _{DATOP}	Data slicer output level Logic '1'	V	V _{ccx} - 0.3		

HPMX-5002 Summary Characterization Information

Typical values measured on test board shown in Figure 1 at $V_{CCX} = 3.0\text{ V}$, $T_A = 25^\circ\text{C}$, $f_{in} = 110.592\text{ MHz}$, $f_{LO2} = 103.68\text{ MHz}$, unless otherwise noted.

Symbol	Parameters and Test Conditions	Units	Typ.	
V_{IH}	CMOS input high voltage (can be pulled up as high as $V_{CC} + 7\text{V}$)	V	$\geq V_{CC} - 0.8$	
V_{IL}	CMOS input low voltage	V	≤ 1.0	
I_{IH}	CMOS input high current	μA	< 50	
I_{IL}	CMOS input low current	μA	> -50	
	Mode switching time	μs	< 1	
$P_1\text{ dB}$	Mixer input 1 dB compression point	matched to $50\ \Omega$ source	dBm	-23
IP_3	Mixer input IP3	matched to $50\ \Omega$ source	dBm	-17
NF_{IF1}	Mixer SSB noise figure (see test diagram Fig. 1)	input matched to $50\ \Omega$ source, $600\ \Omega$ load at output	dB	12
Z_{inIP1}	Mixer input impedance	$50\text{ MHz} < f_{in} < 250\text{ MHz}$	Ω	100
	RSSI dynamic range (for signal input at IFIP1; RSSI output measured with 6 bit ADC)	Note 1	dB	75
	RSSI voltage change	Note 1	mV/dB	17
	RSSI output voltage. $V_{CCX} = 3\text{ V}$, V_{RSSI} is monotonic	2 IF limiter input level: -90 dBm -50 dBm -20 dBm	V	0.88 1.48 2.04
$Z_{outRSSI}$	RSSI output impedance		k Ω	30
$IF2f_3\text{ dB}$	IF2 limiter bandwidth		MHz	45
AV_{IF2}	IF2 limiter voltage gain	Prior to limiting, Note 2	dB	57
$Z_{inIFIP1}$	IF2 limiter input impedance at pin IFIP1	Note 2	Ω	600
V_{outLO2}	LO2 output buffer differential amplitude (between OSCOP and OSCOPB)	$> 1.5\text{ k}\Omega$ differential load, $f_{VCO} = 103.68\text{ MHz}$, $V_{CC} = 3\text{ V}$	mVp-p	335
	Bit slicer time constant ratio	TCSET = 0 vs. TCSET = 1		80:1
	LO2 VCO output buffer noise floor (@ 4 MHz offset)	tank circuit Q = 35	dBc/Hz	-142
	PLL charge pump leakage current		pA	< 100
ILKDET	Lock detector current sink	Logic '0' (unlocked)	mA	1.1

Notes:

- 1: RSSI signal is monotonic over stated dynamic range, but not necessarily linear. Voltage change is defined in the linear region of the transfer curve.
- 2: IF2 frequency in the range $1\text{ MHz} < f < 45\text{ MHz}$, with 10 nF capacitors from DC1A and DC1B to ground.

HPMX-5002 Pin Description

No.	Mnemonic	I/O Type	Description
1	IFOP1	Analog O/P	Output of IF amplifier, feeds quadrature network for discriminator
2	DMOD	Analog I/P	Input to discriminator mixer, driven by output of quadrature network
3	DMODOP	Analog O/P	Output of discriminator mixer, drives external low-pass data filter
4	BUF1	Analog I/P	Noninverting input of buffer amplifier that drives the data slicer
5	BUF2	Analog O/P	Output of buffer amplifier that drives the data slicer
6	TCNT	Analog DC	External capacitor connection which sets time constant for data slicer
7	TCSET	CMOS I/P	Data slicer time constant select
8	DATOP	CMOS O/P	Output bit stream from data slicer
9	RSSI	Analog O/P	Receive Signal Strength Indicator output
10	LKFIL	Analog DC	External capacitor connection which sets time constant for lock detector
11	LKDET	CMOS O/P	Indicates that LO2 PLL is in lock status
12	REF	Analog I/P	Reference signal for LO2 PLL
13	VCC3	DC Supply	PLL supply voltage
14	VEE3	Ground	PLL ground
15	DIV1	CMOS I/P	Controls divide ratio for reference frequency input to the LO2 PLL
16	DIV2	CMOS I/P	Controls divide ratio for reference frequency input to the LO2 PLL
17	DIV3	CMOS I/P	Controls divide ratio for VCO frequency input to the LO2 PLL
20	PFD	Analog O/P	LO2 PLL phase/frequency detector charge pump output
21	VEE4	Ground	LO2 VCO ground
22	VCC4	DC Supply	LO2 VCO supply voltage
23	AGC	Analog DC	External capacitor connection to compensate LO2 VCO AGC loop
24	VCOA	Analog I/P	VCO tank force line
25	VCOB	Analog O/P	VCO tank sense line
26	VCOADJ	Analog I/P	Controls amplitude of buffered LO2 VCO output
27	OSCOA	Analog O/P	Buffered LO2 output (+)
28	OSCOB	Analog O/P	Buffered LO2 output (-)
29	VCC5	DC Supply	1st IF supply voltage
30	VEE5	Ground	1st IF ground
31	IPDC	Analog DC	External capacitor connection for decoupling 1st IF bias point
32	IP1	Analog I/P	1st IF input signal
33	VCC1	DC Supply	IF limiting amplifier supply voltage
34	VEE1	Ground	IF limiting amplifier ground
35	IF1	Analog O/P	Downconverted signal from front-end mixer, drives external filter (hi-Z output, open collector)
37	IFIP1	Analog I/P	Input to IF limiting amplifier, driven by external filter (600 Ω impedance, internally set)
38	DC1A	Analog DC	External capacitor connection for decoupling IF limiting amplifier
39	VCC2	DC Supply	IF limiting amplifier supply voltage
40	VEE2	Ground	IF limiting amplifier ground

HPMX-5002 Pin Description, continued

No.	Mnemonic	I/O Type	Description
41	DC1B	Analog DC	External capacitor connection for decoupling IF limiting amplifier
42	VSUB	Ground	Substrate connection
43	XLO	CMOS I/P	Controls bias to VCO and PLL components in conjunction with PLL pin
44	PLL	CMOS I/P	Controls bias to VCO and PLL components in conjunction with XLO pin
45	RX	CMOS I/P	Controls bias to receive signal path, RSSI, data slicer
47	BGR	Analog DC	External capacitor connection for decoupling bandgap reference voltage
18,19, 36, 46, 48	N/C	Not connected	All unconnected pins should be connected to a low-noise ground

Table 1: HPMX-5002 Mode Control
(CMOS Logic Levels)

Mode	PLL	XLO	RX
PLL	1	0	1
TX	0	0	1
RX	1	0	0
STBY	1	1	1
“flywheel”	see text		

Table 2: HPMX-5002 PLL Divider Programming
(CMOS Logic Levels)

REF divide by:	DIV1	DIV2	DIV3
9	1	0	X
12	0	0	X
16	0	1	X
Not defined	1	1	X
LO2 divide by:			
90	X	X	0
216	X	X	1

Figure 3 illustrates the logic states necessary to program both the reference and LO2 dividers.

The reference divider ratios were selected to conform to the three most popular DECT reference frequencies of 10.368 MHz, 13.824 MHz, and 18.432 MHz. The LO2 divider values allow the use of either a 110.592 MHz or 112.32 MHz 1st IF with a divide value of 90 (which yields a LO2 of 103.68 MHz). In addition, the divide by 216 value permits the use of a much higher 1st IF (222.91 MHz, with a corresponding LO2 of 248.832 MHz), which enables the use of much smaller SAW filters and relaxes the image filtering requirements.

The phase/frequency detector also incorporates a lock detection feature. The user must supply a decoupling capacitor (recommended value of 1 nF) from the LKFIL pin to ground. If the loop is not in phase lock, the LKDET pin will sink up to 1 mA. This open collector output is utilized so that this signal can be wire-ORed with other lock detection circuits, such as from the ILO portion of the system. The pullup resistor can also be tied to the CMOS positive supply, thus eliminating potential problems with CMOS logic high voltages when different positive supplies are used between the radio and the baseband processor. When the PLL loop phase error is less than approximately 0.3 radians, the LKDET current sink goes to zero.

VCO Section

The VCO section has two major components, a sustaining amplifier and a buffered external output. The sustaining amplifier is designed to be used with an

external tank circuit, and incorporates a force (VCOA) and sense (VCOB) architecture to reduce the effects of package parasitics. As described earlier, the VCOB pin may be overdriven by an external LO, in which case the on-chip sustaining amplifier acts as a buffer stage before the downconverting mixer.

The buffered external output is a differential signal (OSCOB, OSCOPB). The buffer also incorporates an AGC loop in order to provide a sinusoidal output signal with constant amplitude which is insensitive to variations in tank Q and loading. This helps to suppress harmonics and eliminates therefore the need for an upconversion filter if the HPMX-5002 is used in a system together with the 2.5 GHz upconverter/downconverter HPMX-5001. The AGC requires an external compensation capacitor (recommended value 1 nF) from the AGC pin to ground.

Signal Path

The input to the HPMX-5002 is an AC-coupled IF signal (IP1). The input buffer before the downconverting mixer requires a decoupling capacitor from the IPDC pin to ground (recommended value 10 pF).

The buffered input is then mixed with the LO2, and the output of the mixer (IF1) drives an off-chip bandpass filter centered at the IF2 frequency (6.9 MHz for a 110.592 MHz 1IF). The filtered signal is then fed to the IFIP1 pin, which is the input to the limiting amplifier chain. The limiting amplifier requires two external decoupling capacitors from pins DC1A and DC1B to ground (recommended value 10 nF).

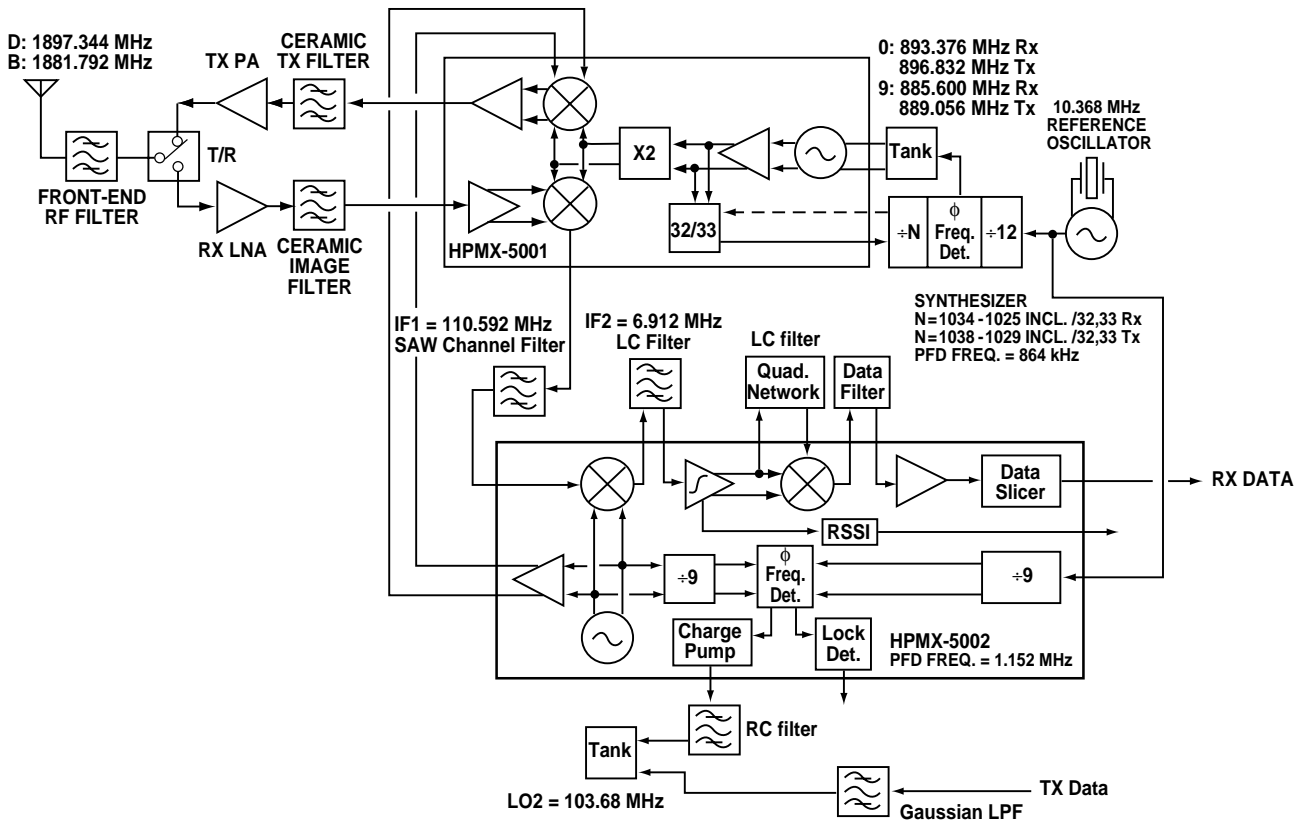

The limiting amplifier chain also feeds the Received Signal Strength Indicator (RSSI) block. The RSSI signal is monotonic over a 75 dB dynamic range, and in its linear range varies at 17 mV/dB. The RSSI signal is designed to be digitized by the CMOS burst mode controller.

The output of the limiting amplifier (IFOP1) drives the discriminator circuit. This signal is fed directly to one of the input ports of a Gilbert cell mixer, and it also drives an external quadrature network (with a recommended Q of 8 for optimum performance). The output of the external quadrature network is then fed into the other input port of the Gilbert cell (via the DMOD pin). The output of the Gilbert cell is taken at the DMODOP pin, which drives an external lowpass filter. To aid in the construction of the filter, a buffer stage is included on-chip. The BUF1 pin is the noninverting input of the buffer, and BUF2 is the output, which is also connected to the input of the data slicer.

The data slicer operates on a dual time constant architecture, controlled via the TCSET pin. During the preamble portion of a DECT timeslot (with TCSET set to 1), the data slicer quickly acquires the midpoint voltage of the incoming data stream, correcting any DC offsets that may have occurred due to frequency deviations within the DECT specification. The value of this initial time constant is determined by an external capacitor connected between TCNT and ground. A 10 nF capacitor allows the accurate acquisition of the midpoint voltage within half of the 16-bit DECT preamble.

Once the midpoint voltage has been acquired, TCSET is then forced to a 0, and the time constant of the midpoint voltage tracking circuit is increased by a factor of 80. This effectively freezes the midpoint voltage from any variations due to normal data transitions, but still allows for some correction of frequency drifts during the data burst.

The output of the data slicer (DATOP) is a CMOS-compatible bitstream. However, it is recommended that an external NPN amplifier stage be used to drive the CMOS baseband processor, in order to minimize the amount of ground and supply currents in the HPMX-5002 which might desensitize the chip.

All other connections go to Burst Mode Controller, power source, or ground.
