

HS-3374RH

Radiation Hardened 8-Bit Bidirectional CMOS/TTL Level Converter

March 1996

Features

- Devices QML Qualified in Accordance with MIL-PRF-38535
- Detailed Electrical and Screening Requirements are Contained in SMD# 5962-9XXXX and Intersil' QM Plan
- Radiation Hardened EPI-CMOS
 - Total Dose 1×10^5 RAD(Si)
 - Latch-Up Immune $> 1 \times 10^{12}$ RAD (Si)/s (Note 1)
- Low Propagation Delay Time
 - Typical CMOS to TTL Pre-RAD 40ns
 - Typical CMOS to TTL Post 100K RAD 40ns
 - Typical TTL to CMOS Pre-RAD 50ns
 - Typical TTL to CMOS Post 100K RAD 50ns
- Low Standby Power
- +10V CMOS and +5V TTL Power Supply Inputs
- Eight Non-inverting Three-State Input/Output Channels
- No External TTL Input Pull-Up Resistors Required
- High TTL Sink Current
- Equivalent to Sandia SA2996
- Military Temperature Range -55°C to $+125^{\circ}\text{C}$

Description

The Intersil HS-3374RH is a radiation hardened 8-bit bidirectional level converter designed to interface CMOS logic levels with TTL logic levels in radiation hardened bus oriented systems. The HS-3374RH is fabricated using a radiation hardened EPI-CMOS process and features eight parallel bidirectional buffer/level converters.

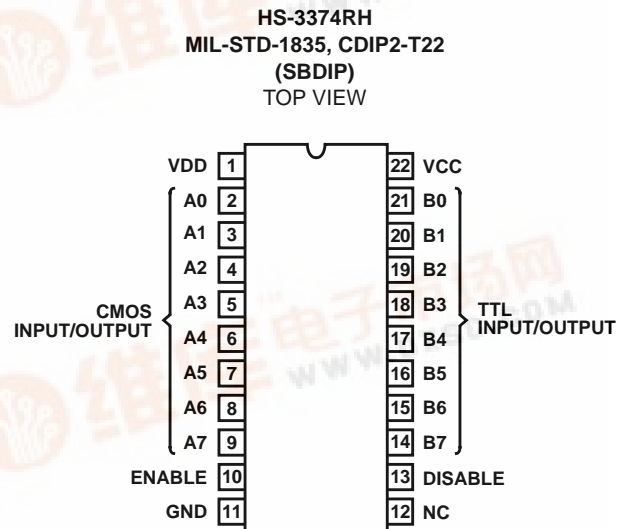

Two control inputs, ENABLE and DISABLE, are used to determine the direction of data flow, and to set both the inputs and outputs in the high impedance state. The control inputs may be driven by either TTL or CMOS logic drivers capable of sinking one standard TTL load.

The HS-3374RH is a non-inverting version of the industry standard CD40116. The non-inverting outputs of the HS-3374RH reduce PC board chip count by eliminating the need to restore data back to a non-inverted format.

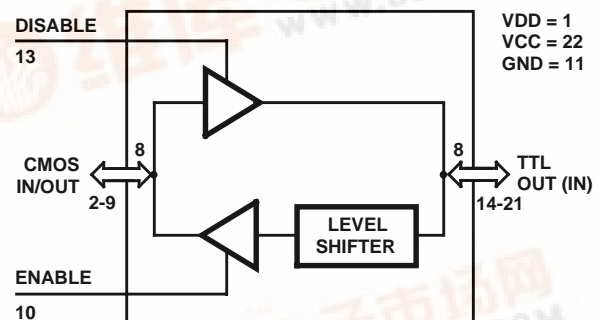

NOTE:

1. For operation at 10V and transient levels above 1×10^{10} RAD (Si)/s, please refer to Application Note 401.

TRUTH TABLE

ENABLE	DISABLE	FUNCTION
X	0	Convert CMOS Level to TTL Level
1	1	Convert TTL Level to CMOS Level
0	1	High Impedance (Z)

0 = Low Level 1 = High Level X = Don't Care
Z = High Impedance on Both CMOS and TTL sides.

NOTE: An important caveat that is applicable to CMOS devices in general is that unused inputs should never be left floating. This rule applies to inputs connected to a three-state bus. The need for external pull-up resistors during three-state bus conditions is eliminated by the presence of regenerative latches on the following HS-3374RH pins: A0 - 7.

The functional block diagram depicts one of these pins with the regenerative latch. When the CMOS driver assumes the high impedance state, the latch holds the bus in whatever logic state (high or low) it was before the three-state condition. A transient drive current of $\pm 1.5\text{mA}$ at $V_{DD}/2 \pm 0.5\text{V}$ for 10ns is required to switch the latch. Thus, CMOS device inputs connected to the bus are not allowed to float during three-state conditions.

* WARNING: Do not activate the Disable input by hardwiring to any TTL input pins. This is an incorrect mode of operation.
