

**HOLTEK**

**HT82V733**

**240mA Audio Power Amp**

## Features

- High signal-to-noise ratio
- High slew rate
- Low distortion
- Large output voltage swing
- Excellent power supply ripple rejection
- Low power consumption
- Short-circuit elimination
- Wide temperature operating range
- No switch ON/OFF clicks
- Low standby current
- Power off control
- Direct drive speaker
- 8-pin DIP/SOP package

## General Description

HT82V733 is an integrated class AB mono speaker driver contained in an SOP-8 package. The device is

fabricated in a CMOS process and has been primarily developed for portable digital audio applications.

## Pin Assignment

## Pin Description

Pin No.	Pin Name	I/O	Description
1	OUTN	O	Negative output
2	Aud In	I	Audio input
3	VREF	O	Speaker non-inverting input voltage reference
4	VSS	—	Negative power supply, ground
5	$\overline{\text{CE}}$	I	Chip enable, low active
6	NC	—	Not connected
7	OUTP	O	Positive output
8	VDD	—	Positive power supply

## Absolute Maximum Ratings

Supply Voltage .....	$V_{SS}-0.3\text{V}$ to $V_{SS}+5.5\text{V}$	Storage Temperature .....	$-50^{\circ}\text{C}$ to $125^{\circ}\text{C}$
Input Voltage .....	$V_{SS}-0.3\text{V}$ to $V_{DD}+0.3\text{V}$	Operating Temperature .....	$-20^{\circ}\text{C}$ to $70^{\circ}\text{C}$

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

## Functional Description

### OUTP Rising Time ( $t_R$ )

When  $\overline{CE}$  active low, the HT82V733 need rising time to output fully on OUTP pin. However, the rising time depends on C1. (\*see the application circuits)

Capacitor $t_R$ Voltage	0.1 $\mu$ F	1 $\mu$ F	4.7 $\mu$ F	10 $\mu$ F
2.2V	15ms	30ms	90ms	185ms
3V	15ms	30ms	90ms	185ms
4V	15ms	30ms	90ms	185ms

For battery based applications, power consumption is a key issue, therefore the amplifier should be turned off when in the standby state. In order to eliminate any speaker sound bursts while turning the amplifier on, the application circuit, which will incorporate a capacitance value of C1, should be adjusted in accordance with the speaker's audio frequency response. A greater value of C1 will improve the noise burst while turning on the amplifier. The recommended operation sequence is:

Turn On: audio1 signal standby (1/2 VDD)  $\rightarrow$  enable amplifier  $\rightarrow$  wait  $t_R$  for amplifier ready  $\rightarrow$  audio1 output

Turn Off: audio1 signal finished  $\rightarrow$  disable amplifier  $\rightarrow$  wait  $t_R$  for amplifier off  $\rightarrow$  audio1 signal off

If the application is not powered by batteries and there is no problem with amplifier On/Off issue, a capacitor value of 0.1 $\mu$ F for C1 is recommended.
