Transceivers/registers

74F651A Octal transceiver/register, inverting (3-State)
74F652A Octal transceiver/register, non-inverting (3-State)

## FEATURES

- Combines 74F245 and two 74F374 type functions in one chip
- High impedance base inputs for reduced loading ( $70 \mu \mathrm{~A}$ in high and low states)
- Independent registers for $A$ and $B$ buses
- Multiplexed real-time and stored data
- Choice of non-inverting and inverting data paths
- 3-State outputs
- Industrial temperature range available $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$ for 74F652A

## DESCRIPTION

The 74F651A and 74F652A transceivers/registers consist of bus transceiver circuits with 3-State outputs, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or the internal registers. Data on the A or $B$ bus will be clocked into the registers as the appropriate clock pin goes high. Output enable (OEAB, OEBA) and select (SAB, SBA) pins are provided for bus management.

Transceivers/registers

The following examples demonstrate the four fundamental bus-management functions that can be performed with the 74F651A and 74F652A. The select pins determine whether data is stored or
transferred through the device in real time. The output enable pins determine the direction of the data flow.

## Notes to function table

1. $\mathrm{H}=$ High-voltage level
2. $L=$ Low-voltage level
3.     * = The data output function may be enabled or disabled by various signals at the $\overline{O E B A}$ and OEAB inputs. Data input functions are always enabled, i.e., data at the bus pins will be stored on every low-to-high transition of the clock.
4. $\uparrow=$ Low-to-high clock transition
5. $X=$ Don't care

## NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\text {amb }}=25^{\circ} \mathrm{C}$.
3. $\mathrm{I}_{\mathrm{O}}$ is tested under conditions that produce current approximately one half of the true short-circuit output current (los).

## Note to AC setup requirements for 74F652A

1. Setup time is to protect against surge current caused by enabling 16 outputs ( 48 mA per output) simultaneously.

## AC WAVEFORMS

For all waveforms, $\mathrm{V}_{\mathrm{M}}=1.5 \mathrm{~V}$.
The shaded areas indicate when the input is permitted to change for predictable output performance.

Waveform 1. Propagation delay for clock input to output, clock pulse width, and maximum clock frequency

Waveform 3. Propagation delay for An to Bn or Bn to An and SAB or SBA to An or Bn

Waveform 5. OEBA to OEAB setup time and hold times

Waveform 7. 3-State output enable time to high level and output disable time from high level

Waveform 2. Propagation delay for An to Bn or Bn to An and SAB or SBA to An or Bn

Waveform 4. Data setup time and hold times

Waveform 6. OEAB to OEBA setup time and hold times

Waveform 8. 3-State output enable time to low level and output disable time from low level

## Definitions

Short-form specification - The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.
Application information - Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## Disclaimers

Life support - These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.
Right to make changes - Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
