Features

- 101,376 (352x288) pixels, CIF format, used with 1/7" optical system
- Correlated double sampling
- On-chip 9-bit ADC
- On-chip digital signal processing
 - Real-time color interpolation
 - Programmable/Automatic exposure control
 - Programmable/Automatic white balancing and color correction
 - Programmable sharpening control
 - Programmable color saturation control
 - Programmable gamma correction
 - Programmable brightness correction
 - Programmable hue correction
 - Programmable contrast correction
 - Programmable anti-flickering (50Hz, 60Hz or off, like outdoor)
- Progressive readout
- Video mode and single frame mode
- Output data format: 8/16-bit YUV/YCbCr, 24-bit RGB, 16-bit RGB, 8-bit raw data
- Output modes: CIF and Sub-sampling QCIF, programmable
- Input/output interface: SIF
- Power down mode
- Automatic optical black compensation
- Left-Right Mirror image
- Up-down Mirror image
- Single power supply, 2.8+/- 0.2V and/or 3.3V +/- 0.15V

General Description

This is a single-chip digital color imaging device. It incorporates a 352 x 288 sensor array operating at max. 30 frames per second in progressive manner. Each pixel is covered by a color filter, which formed a so-called Bayer pattern. Correlated double sampling is performed by the internal ADC and timing circuitry.

Depending on the brightness of the scene, the raw data can be adjusted by the digital gain for all pixels, or be adjusted separately for the 4 Bayer pattern pixels. This is done either by the built-in automatic exposure control circuit, or can be done manually by the external CPU via serial bus control.

The data are then processed by the color interpolation module so that each pixel will get a complete set of RGB values. To correct or enhance color, automatic white balance circuit is built-in. The user may perform white balancing and color correction manually by external CPU via serial bus too. Color saturation control is programmable via serial bus, if user is not satisfied with the default settings

At the final stage, the gamma correction can also be performed, in addition to default value. The output formats include 8/16-bit YUV or YCbCr, 24-bit, 16-bit RGB, and 8-bit raw data which can be fed to other DSP, color processing, or compression chips.

Application

- Video cellular phone
- PDA
- Digital camcorder
- Digital still camera
- Video phone
- Video conferencing
- Video mail
- PC camera
- Security system
- Visual toy
- Industrial image capture/analysis
- Environment monitor system

Key Parameters

- Number of Active Pixels: 352 x 288
- Number of Physical Pixels: 362 x 298
- Frame Rate: from 30 to 1 fps, flexible
- Pixel Size: 6.0 μm x 6.0 μm
- Sensor Area: 2.2 mm x 1.8 mm (for 1/7" lens)
- Main Clock Frequency: 3 to 12 MHz
- Exposure Time: 83 μs (@ 30 fps, 1 line, 12 MHz) ~ 164 s (@ 1 fps, 65535 lines, 12 MHz), every step: 83 μs
- Digital gain 1x - 64x @ 2^N for all pixels
- RGB gain from 1/256 to 8 in step of 1/256 for individual Bayer pattern pixels
- S/N Ratio: TBD dB @ TBD lux
- Target Power Supply: 2.8V +/- 0.2V
- Target Power Requirement: <31mW (@ 15fps, 6 MHz, 2.8V),
- Package: Shrunk Plastic LCC48 (ICM202Bsa)

202B Pin Assignment

Pin #	Name	Class*	Function Descriptions
13	Xin	A, I	Crystal in
14	Xout	A, O	Crystal out
2	PCLK	D, O	Pixel clock output
21	TEST	D, I, N	Test Mode Input Pin
22	SYNCMODE	D, I,	Sync. Mode. 0: External Sync, 1: Internal Sync
23	PWRDOWN	D, I,	Power Down Mode. 0:Enable 1:Disable
25	Enable	D, I,	Data Output . 0:Disble 1:Enable
24	I2CA	D, I,	LSB of serial bus address. 0: Device ID address 0x20 1: Device ID address 0x21

26	SCLOCK	D, I/O	Serial bus clock
27	SDATA	D, I/O	Serial bus data
16	GNDS	P	Subtract GND
18	RSET	A, I	Resistor to ground 51 K Ω @ Clock = 12Mhz
10	RSTN	D, I, U	Chip reset, active low
45, 46, 47, 48, 1, 3, 4, 9	DOUT[7:0] (msb:lsb)	D, O	Sensor Data output[7:0]
28, 30, 34, 35, 36, 37, 38, 39	DOUT[15:8] (msb:lsb)	D, I/O	1) Input: Test Data Input 2) Sensor Data output[15:8]
41	HSYNC	D, I/O	Horizontal sync signal
42	VSYNC	D, I/O	Vertical sync signal
40	BLANK	D, O	Video blank signal
15	RAMP	A, O	Analog ramp output
11, 33	AVDD	P	Analog power
12, 32	AGND	P	Analog ground
6, 19, 43	DVDD	P	Digital power
5, 17, 44	DGND	P	Digital ground
7, 31	PVDD	P	Pad power
8, 29	PGND	P	Pad ground

Class Code:

A - Analog signal, D - Digital signal, I - Input, O - Output, P - Power or ground,
U - Internal pull-up, N - Internal pull-down

Functional Description

1.1 Image Array

The image array consists of 352x288 pixels. Each pixel has a light sensitive photo diode and a set of control and transfer transistors. At the beginning of the cycle, a row of pixels are pre-charged to its maximum value. Then they are exposed to light for several lines worth of time and sampled by the ADC. Correlated double sampling (CDS) is performed by subtracting the reset value (sampled right before sampling the signal) from the signal value. The purpose of CDS is to eliminate the point-wise fixed pattern noise (FPN). The output of CDS is approximately proportional to the amount of received light, ranging from 0 to 255.

1.2 Color Filter

Each pixel is covered by a color filter. They form the Bayer Pattern as shown in Figure 2. (Row 0, Column 0) is covered by a Red filter, (Row 0, Column 1) and (Row 1, Column 0) by Green filters, and (Row 1, Column 1) by a Blue filter. Since each pixel only gets part of the frequency band, the data need further processing (i.e., color interpolation and color correction) in order to approximate the full visible spectrum.

R	G	R	G	R	G	R	G
G	B	G	B	G	B	G	B
R	G	R	G	R	G	R	G
G	B	G	B	G	B	G	B

Figure 2. Color filter Bayer pattern

1.3 Exposure and Gain Control

The brightness of the scene may change by a great amount that renders the captured image either over-exposed or under-exposed. To accommodate for different brightness, the user may change the exposure time by adjusting the AD_EXPOSE_TIMEH, and AD_EXPOSE_TIMEL. The exposure time is measured in terms of the time to read out one line of data, which is equal to 83.3 μ s (assuming the line length is 500 @ 12 MHz). If the number of lines per frame is set at 400 (the default), the exposure time can vary from 1 to 399 lines. In addition, users can adjust bit 7 to 5 of register AD_COL_BEGINH to digitally boost the output value by 1 to 64 times @ 2^N for all the pixels. Furthermore, users can adjust registers AD_M1_L, AD_M1_H, AD_M2_L, AD_M2_H, AD_M3_L, AD_M3_H, AD_M4_L, AD_M4_H, to optimize the RGB gain (from 1/256 to 8) of the 4 Bayer pattern pixels separately.

50/60Hz anti-flickering control

To eliminate the flickering caused by the 50Hz or 60Hz light source normally found indoor, an anti-flickering control circuit is build in. The selection is between off and on. When it is on, then the selection is between 50 or 60Hz. Register address is to be defined.

Auto Exposure

The Auto Exposure circuit control the Exposure Time, Digital Gain, and Anti-flickering function automatically. The following features are provided:

- . Disable/Enable AE
- . Disable/Enable Anti-flickering
- . Disable/Enable Digital Gain
- . Disable/Enable Fix Frame Rate
- . Adjustable Maximum/Minimum Frame Rate
- . Adjustable AE Target brightness value

The following registers are use to control these features:

0x3A (AD_AE_CTRL, Default = 7)

- bit 0 : Disable/Enable AE
 - bit 1 : Disable/Enable Digital Gain
 - bit 2 : Disable/Enable Anti-flickering
 - bit 3 : Disable/Enable Fix Frame Rate
- The default value enable AE, Anti-flickering, and Digital Gain.

0x3B (AD_AE_HIGH, AE Target value High Limit, Default = 0x65)

0x3C (AD_AE_LOW, AE Target value Low Limit, Default = 0x55)

Use AD_AEHIGH and AD_AELOW to set the target brightness of AE function.

0x3F, 0x40 (AD_MAXFH, Maximum Frame Height, Default = 0xffff)

AD_MAXFH set the minimum frame rate of AE .

0x41, 0x42 (AD_MINFH, Minimum Frame Height, Default = 0x190)

AD_MINFH set the maximum frame rate of AE .

0x44 (AD_AFSTEP, Anti-flickering Exposure Time Step, Default = 0x64)

Use AD_AFSTEP to setup 50 / 60HZ Anti-flickering step.

1.4 Color Interpolation

Since the raw data coming out the sensor array has only one of the R, G, or B value for each pixel, we need to perform interpolation to obtain a set of correlated RGB value for each pixel. The method used is based on a 3x3 interpolation window. The result of this operation is a data stream consisting of 24-bit RGB per pixel. After this step, the whole frame can be viewed as a color picture. However, since the RGB filters and the photodiode are not perfect, the RGB values may have different strength. In addition, there are some cross-talk among the RGB channels. That's why we need the color correction (or white balancing) step.

1.5 Auto White Balancing

Due to the different transparency and the overlapping spectrum response of the R, G, and B filters, the interpolated color may not be balanced. The Auto White Balancing performs the White Balance function automatically. The following registers are used to control the AWB function:

0x33 (AD_AWB_CTRL, Default = 3)

- 0 : Disable AWB
- 1 : Enable AWB with R,G,B range limited
- 3 : Enable AWB with no range limited

0x34 (AD_AWB_OVERFLOW, Default = 255)

Set the overflow value of the sampling pixel, if the sampling data is larger than AD_AWB_OVERFLOW, then it will not be used for AWB processing. The default value 255 means there is no limit on sampling data.

0x35 (AD_AWB_BRIGHT, Default = 0)

Set the minimum bright value of the sampling pixel, if the sampling data is less than AD_AWB_BRIGHT, then it will not be used for AWB processing. The default value 0 means there is no limit on sampling data.

When AWB function is disabled, the following registers are used to adjust the White Balance manually:

0x37 (AD_WB_RED, Default = 0x80)

Set the RED Gain manually.

0x38 (AD_WB_GREEN, Default = 0x80)

Set the GREEN Gain manually.

0x39 (AD_WB_BLUE, Default = 0x80)

Set the BLUE Gain manually.

1.6 Sharpening

The following registers are used to control the Sharpening function:

0x30 (AD_SHARP_CTRL, Default = 9)

- 0 : Disable Sharpening.
- 8 : Sharpen Weight = 0.5 (light Sharpening)
- 9 : Sharpen Weight = 1 (default)
- a : Sharpen Weight = 1.5
- b : Sharpen Weight = 2
- c : Sharpen Weight = 2.5
- d : Sharpen Weight = 3
- e : Sharpen Weight = 3.5
- f : Sharpen Weight = 4 (heavy Sharpening)

0x31 (AD_SHARP_HIGH, Default = 5)

Sharpening High Tone Threshold.

0x32 (AD_SHARP_LOW, Default = 2)

Sharpening Low Tone Threshold.

1.7 Color saturation control

The color saturation can be enhanced by adjusting the Saturation Factor register 0x2D (AD_SATURATION, Default = 0x30).

The following examples show how to set the Saturation to 0, 1, 1.5, and 2:

Saturation 0 : AD_SATURATION = 0x00, no color (B/W)
1 : AD_SATURATION = 0x20
1.5: AD_SATURATION = 0x30
2.0: AD_SATURATION = 0x40

1.8 Gamma Correction

To boost darker signal to match the video monitor characteristic, gamma correction are performed:
Use register 0x24 (AD_GAMMA) to select one of them:

AD_GAMMA 0 : Gamma = 1 (no Gamma)
AD_GAMMA 1 : Gamma = 1.3
AD_GAMMA 2 : Gamma = 1.5
AD_GAMMA 3 : Gamma = 1.8
AD_GAMMA 4 : Gamma = Normal Mode
AD_GAMMA 5 : Gamma = Brighter Mode
AD_GAMMA 6 : Gamma = Higher Contrast Mode

1.10 Brightness

The Brightness offset can be adjusted by Brightness Offset register 0x2B (AD_BRIGHT_OFFSET, Default =0). The default value =0 means the Brightness is not adjusted.

The following examples show how to increase/decrease the Brightness Level:

Increase Brightness by 10: AD_BRIGHT_OFFSET = 0x0A
Decrease Brightness by 10: AD_BRIGHT_OFFSET = 0x8A

1.11 Hue

The Hue function is used to change the image color temperature. The color temperature is changed by rotating the (U,V) vector:

$$U' = U * \cos + V * \sin$$

$$V' = U * \sin - V * \cos$$

The value of COS and SIN is define in the following registers:

0x29 (AD_SIN, Default = 0)

The SIN value. Default = 0x00 is equal to AD_SIN = 0.

0x2A (AD_COS, Default = 0x7F)

The COS value. Default = 0x7F is equal to AD_COS = 1.

1.12 Contrast

The Contrast function is control by the following function

$$Y' = Y * \text{CONTRAST}$$

The following registers:

0x28 (AD_CONTRAST, Default = 0x20)

Unsigned 1.5 format.

1.13 Output Format

The following output data format is provided:

8-bit YUV

8-bit YCbCr

16-bit YUV

16-bit YCbCr

16-bit RGB

24-bit RGB

8-bit raw data

The output mode can be CIF or Sub-sampling QCIF. Register 0x52 (AD_OUTSEL) is used to select the various output format and output mode.

The following table lists the user modes and the corresponding signals appeared on the pins.

Format	DOUT[15:8]	DOUT[7:0]	PCLK(CIF)	PCLK(QCIF)
8-bit 4:2:2 YUV	0	Y, U, Y, V...	12 MHz	6 MHz
8-bit 4:2:2 YCbCr	0	Y,Cb,Y,Cr ...	12 MHz	6 MHz
16-bit 4:2:2 YUV	Y, Y, ...	U,V, ...	6 MHz	3 MHz
16-bit 4:2:2 YCbCr	Y, Y, ...	Cb, Cr, ...	6 MHz	3 MHz
16-bit RGB (5,6,5)	RG	GB	6 MHz	3 MHz
24-bit RGB	G, G, ...	R, B, ...	12 MHz	6 MHz

2. Control Registers by serial bus

Note : *1 Need PART_CONTROL [7] to change value

*2 Need PART_CONTROL [2] to change value

Address	Name	Default	Description
0x00	PART_CONTROL	0x00	Processing control [0] Mode select 0: Normal mode, 1: Single frame mode [2] Exposure time control, writing a 1 will activate the new value set in AD_EXPOSE_TIME, when read back from it, 0 means either the exposure time change is finished (in video mode) or the entire frame is transmitted (in single frame mode), 1 means either the exposure time change is still in progress (in video mode) or the frame is yet to finish (in single frame mode) [6:3] Frame rate, 0: 30 fps 1: 15 fps 2: 10 fps 3: 6 fps 4: 5 fps 5: 3 fps 6: 2 fps 7: 1 fps [7] Latent change, writing a 1 means the changed latent registers now starts taking effect, when the entire operation is done, the read back value of this bit will change from 1 to 0.

3. Electrical Characteristics

3.1 DC Characteristics

Symbol	Parameter	Rating			Unit
		Minimum	Typical	Maximum	
V _{CCA}	Absolute Power Supply	-0.3		3.8	V
V _{INA}	Absolute Input Voltage	-0.3		V _{CC} + 0.3	V
V _{OUTA}	Absolute Output Voltage	-0.3		V _{CC} + 0.3	V
T _{STG}	Storage Temperature	0	25	65	°C
V _{CC}	Operating Power Supply	2.6	2.8	3.6	V
V _{IN}	Operating Input Voltage	0		V _{CC}	V
T _{OPR}	Operating Temperature	0	25	55	°C
I _{DD}	Operating Current @ V _{CC} =2.8 V, 25 °C @6MHz		11		mA
I _{IL}	Input Low Current	-1		1	μA
I _{IH}	Input High Current	-1		1	μA
I _{OZ}	Tri-state Leakage Current	-10		10	μA
C _{IN}	Input Capacitance		3		pF
C _{OUT}	Output Capacitance		3		pF
C _{BID}	Bi-directional Buffer Capacitance		3		pF
V _{IL}	Input Low			0.3 * V _{CC}	V

	Voltage				
V _{ILS}	Schmitt Input Low Voltage		1.1		V
V _{IH}	Input High Voltage	0.7 * V _{CC}			V
V _{IHS}	Schmitt Input High Voltage		1.8		V
V _{OL}	Output Low Voltage			0.4	V
V _{OH}	Output High Voltage	2.4			V
R _L	Input Pull-up/dow n Resistance		50		KΩ

3.2 Timing

CIF Timing

*1:(Default Value)

*2:Pixel Define:

8-bit YUV,YCbCr,RGB mode : 1 pixel = 2 pixel clock, pixel clock=12Mhz

16-bit YUV,YCbCr,RGB mode : 1 pixel = 1 pixel clock, pixel clock=6Mhz

24-bit RGB mode : 1 pixel = 2 pixel clock, pixel clock=12Mhz

QCIF Timing

*1:(Default Value)

*2:Pixel Define:

8-bit YUV,YCbCr,RGB mode : 1 pixel = 2 pixel clock, pixel clock=6Mhz

16-bit YUV,YCbCr,RGB mode : 1 pixel = 1 pixel clock, pixel clock=3Mhz

24-bit RGB mode : 1 pixel = 2 pixel clock, pixel clock=6Mhz

Pixel Clock Duty Cycle

In different frame rate mode (controlled by PART_CONTROL[6:3]), the duty cycle (high time / clock period) of the PCLK signal is described in the following table:

Frame Rate	Duty Cycle
30	50.0%
15	50.0%
10	66.6%
6	60.0%
5	50.0%
3	50.0%
2	53.3%
1	50.0%
