

SONY**ICX054AK****1/3-inch CCD Image Sensor for NTSC Color Camera****Description**

The ICX054AK is an interline CCD solid-state image sensor suitable for NTSC 1/3-inch color video cameras. High sensitivity is achieved through the adoption of Ye, Cy, Mg and G complementary color mosaic filters and HAD (Hole-Accumulation Diode) sensors.

This chip features a field period readout system, and an electronic shutter with variable charge-storage time.

Features

- High sensitivity (+3dB compare with ICX044BKA) and low dark current
- Continuous variable-speed shutter
1/60s (Typ.), 1/100s to 1/10000s
- Low smear
- Excellent antiblooming characteristics
- Ye, Cy, Mg and G complementary color mosaic filters on chip
- Horizontal register: 5V drive
- Reset gate: 5V drive

Device Structure

- Optical size: 1/3-inch format
- Number of effective pixels: 510 (H) x 492 (V) approx. 250K pixels
- Number of total pixels: 537 (H) x 505 (V) approx. 270K pixels
- Interline CCD image sensor
- Chip size: 6.00mm (H) x 4.96mm (V)
- Unit cell size: 9.6 μ m (H) x 7.5 μ m (V)
- Optical black:

Horizontal (H) direction:	Front 2 pixels, Rear 25 pixels
Vertical (V) direction:	Front 12 pixels, Rear 1 pixel
- Number of dummy bits:

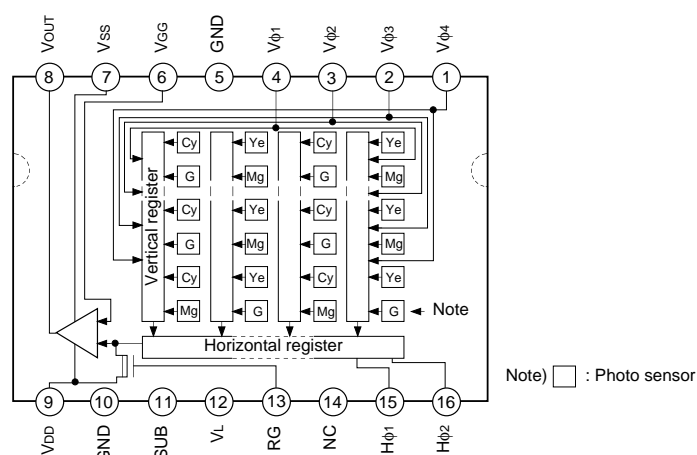

Horizontal	16
Vertical	1 (even field only)
- Substrate material: Silicon

16 pin DIP (Plastic)

(3) Horizontal transfer clock waveform

(4) Reset gate clock waveform

V_{RGLH} is the maximum value and V_{RGLL} is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG.

In addition, V_{RGL} is the average value of V_{RGLH} and V_{RGLL} .

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2$$

Assuming V_{RGH} is the minimum value during the interval t_{wh} , then:

$$V_{\phi RG} = V_{RGH} - V_{RGL}$$

Image Sensor Characteristics Measurement Method

◎ Measurement conditions

- 1) In the following measurements, the substrate voltage and the reset gate clock voltage are set to the values indicated on the device, and the device drive conditions are at the typical values of the bias and clock voltage conditions.
- 2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black level (OB) is used as the reference for the signal output, which is taken as the value of Y signal output or chroma signal output of the measurement system.

◎ Color coding of this image sensor & Composition of luminance (Y) and chroma (color difference) signals

As shown in the left figure, fields are read out. The charge is mixed by pairs such as A1 and A2 in the A field. (pairs such as B in the B field)

As a result, the sequence of charges output as signals from the horizontal shift register (Hreg) is, for line A1, (G + Cy), (Mg + Ye), (G + Cy), and (Mg + Ye).

These signals are processed to form the Y signal and chroma (color difference) signal. The Y signal is formed by adding adjacent signals, and the chroma signal is formed by subtracting adjacent signals. In other words, the approximation:

$$Y = \{(G + Cy) + (Mg + Ye)\} \times 1/2 \\ = 1/2 \{2B + 3G + 2R\}$$

is used for the Y signal, and the approximation:

$$R - Y = \{(Mg + Ye) - (G + Cy)\} \\ = \{2R - G\}$$

is used for the chroma (color difference) signal. For line A2, the signals output from Hreg in sequence are (Mg + Cy), (G + Ye), (Mg + Cy), (G + Ye).

The Y signal is formed from these signals as follows:

$$Y = \{(G + Ye) + (Mg + Cy)\} \times 1/2 \\ = 1/2 \{2B + 3G + 2R\}$$

This is balanced since it is formed in the same way as for line A1.

In a like manner, the chroma (color difference) signal is approximated as follows:

$$-(B - Y) = \{(G + Ye) - (Mg + Cy)\} \\ = -\{2B - G\}$$

In other words, the chroma signal can be retrieved according to the sequence of lines from $R - Y$ and $-(B - Y)$ in alternation. This is also true for the B field.

◎ Definition of standard imaging conditions

1) Standard imaging condition I:

Use a pattern box (luminance 706cd/m², color temperature of 3200K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

2) Standard imaging condition II:

Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

1. Sensitivity

Set to standard imaging condition I. After selecting the electronic shutter mode with a shutter speed of 1/250s, measure the Y signal (Ys) at the center of the screen and substitute the value into the following formula.

$$S = Y_s \times \frac{250}{60} \text{ [mV]}$$

2. Saturation signal

Set to standard imaging condition II. After adjusting the luminous intensity to 10 times the intensity with average value of the Y signal output, 200mV, measure the minimum value of the Y signal.

3. Smear

Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity to 500 times the intensity with average value of the Y signal output, 200mV. When the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value YSm [mV] of the Y signal output and substitute the value into the following formula.

$$S_m = \frac{Y_{Sm}}{200} \times \frac{1}{500} \times \frac{1}{10} \times 100 \text{ [%]} \text{ (1/10V method conversion value)}$$

4. Video signal shading

Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity so that the average value of the Y signal output is 200mV. Then measure the maximum (Ymax [mV]) and minimum (Ymin [mV]) values of the Y signal and substitute the values into the following formula.

$$SH_y = (Y_{max} - Y_{min})/200 \times 100 \text{ [%]}$$

5. Uniformity between video signal channels

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then measure the maximum (Crmax, Cbmax [mV]) and minimum (Crmin, Cbmin [mV]) values of the R – Y and B – Y channels of the chroma signal and substitute the values into the following formula.

$$\Delta S_r = |(Cr_{max} - Cr_{min})/200| \times 100 \text{ [%]}$$

$$\Delta S_b = |(Cb_{max} - Cb_{min})/200| \times 100 \text{ [%]}$$

6. Dark signal

Measure the average value of the Y signal output (Ydt [mV]) with the device ambient temperature 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

7. Dark signal shading

After measuring 6, measure the maximum (Y_{dmax} [mV]) and minimum (Y_{dmin} [mV]) values of the Y signal output and substitute the values into the following formula.

$$\Delta Y_{dt} = Y_{dmax} - Y_{dmin} \text{ [mV]}$$

8. Flicker

1) F_y

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then measure the difference in the signal level between fields (ΔY_f [mV]). Then substitute the value into the following formula.

$$F_y = (\Delta Y_f / 200) \times 100 \text{ [%]}$$

2) F_{cr} , F_{cb}

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, insert an R or B filter, and then measure both the difference in the signal level between fields of the chroma signal (ΔC_r , ΔC_b) as well as the average value of the chroma signal output (C_{Ar} , C_{Ab}). Substitute the values into the following formula.

$$F_{ci} = (\Delta C_i / C_{Ai}) \times 100 \text{ [%]} \text{ (i = r, b)}$$

9. Line crawls

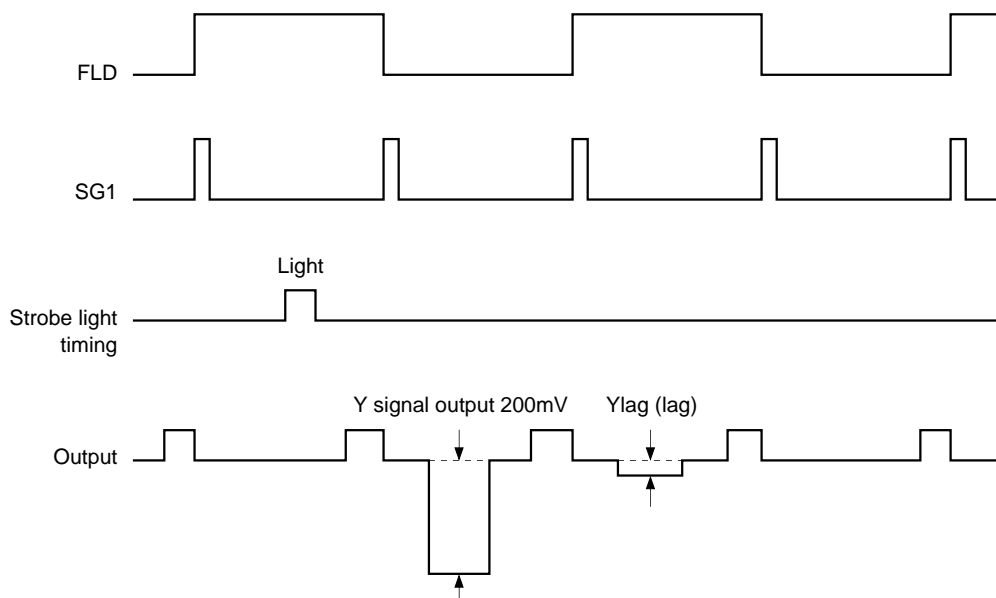

Set to standard imaging condition II. Adjust the luminous intensity so that the average value of the Y signal output is 200mV, and then insert a white subject and R, G, and B filters and measure the difference between Y signal lines for the same field (ΔY_{lw} , ΔY_{lr} , ΔY_{lg} , ΔY_{lb} [mV]). Substitute the values into the following formula.

$$L_{ci} = (\Delta Y_{li} / 200) \times 100 \text{ [%]} \text{ (i = w, r, g, b)}$$

10. Lag

Adjust the Y signal output value generated by strobe light to 200mV. After setting the strobe light so that it strobes with the following timing, measure the residual signal (Y_{lag}). Substitute the value into the following formula.

$$Lag = (Y_{lag} / 200) \times 100 \text{ [%]}$$

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- a) Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- b) When handling directly use an earth band.
- c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- d) Ionized air is recommended for discharge when handling CCD image sensor.
- e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

2) Soldering

- a) Make sure the package temperature does not exceed 80°C.
- b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero cross On/Off type and connect it to ground.

3) Dust and dirt protection

- a) Operate in clean environments (around class 1000 is appropriate).
- b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)
- c) Clean with a cotton bud and ethyl alcohol if the grease stained. Be careful not to scratch the glass.
- d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Do not expose to strong light (sun rays) for long periods, color filters will be discolored.

5) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.

6) CCD image sensors are precise optical equipment that should not be subject to mechanical shocks.

Unit: mm
