

IMP6303

POWER MANAGEMENT

3-Pin Microcontroller Power Supply Supervisor

The IMP6303 is a 4.0V power supply supervisor circuits optimized for low-power microprocessor (μP), microcontroller (μC) and digital systems.

A reset signal is issued if the power supply voltage drops below a preset reset threshold and is asserted for at least 140ms after the supply has risen above the reset threshold. The IMP6303 has an active-low $\overline{\text{RESET}}$ output that is guaranteed to be in the correct state for V_{CC} down to 1.1V. The reset comparator is designed to ignore fast transients on V_{CC} .

Low supply current makes the IMP6303 ideal for use in portable and battery operated equipment. The IMP6303 is available in a compact 3-pin SOT23, TO-92 and 5 pin SOT23-5 packages.

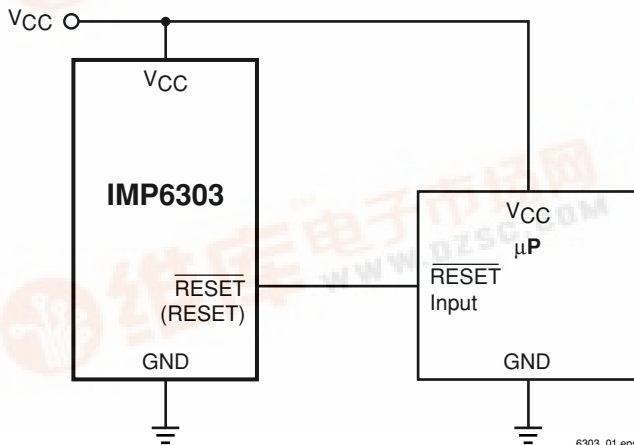

Key Features

- ◆ Monitor 4.0V supply
- ◆ 140ms min. reset pulse width
- ◆ Active-low reset valid with 1.1V supply
- ◆ Small 3-pin SOT-23 package
- ◆ Small 3-pin TO-92 package
- ◆ Small 5-pin SOT-23-5 package
- ◆ No external components
- ◆ Specified over full temperature range
— -40°C to 105°C

Applications

- ◆ Embedded controllers
- ◆ Battery operated systems
- ◆ Intelligent instruments
- ◆ Wireless communication systems
- ◆ PDAs and handheld equipment

Notes: 1. Production testing done at $T_A = 25^\circ\text{C}$. Over-temperature specifications guaranteed by design only.
 2. $\overline{\text{RESET}}$ output is active LOW for the IMP6303.

Pin Descriptions

Name	Function
GND	Ground
$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ is asserted LOW if V_{CC} falls below the reset threshold and remains LOW for the 240ms typical reset timeout period (140ms minimum) after V_{CC} exceeds the threshold.
V_{CC}	Power supply input voltage.

Detailed Descriptions

Reset Timing

The reset signal is asserted–LOW when the V_{CC} signal falls below the threshold trip voltage and remains asserted for 140ms minimum after the V_{CC} has risen above the threshold.

Application Information

Negative V_{CC} Transients

The IMP6303 protect μ Ps from brownouts and low V_{CC} . Short duration transients of 100mV amplitude and 20 μ s or less duration typically do not cause a false RESET.

Valid Reset with V_{CC} under 1.1V

To ensure logic inputs connected to the IMP6303 $\overline{\text{RESET}}$ pin are in a known state when V_{CC} is under 1.1V, a 100k Ω pull-down resistor at RESET is needed. The value is not critical.

Bi-directional Reset Pin Interfacing

The IMP6303 can interface with μ P/ μ C bi-directional reset pins by connecting a 4.7k Ω resistor in series with the IMP6303 reset output and the μ P/ μ C bi-directional reset pin.
