## CURRENT MODE REGULATING PULSE WIDTH MODULATORS

### FEATURES

- Guaranteed  $\pm 1\%$  reference voltage tolerance
- Guaranteed  $\pm 10\%$  frequency tolerance
- Low start-up current ( $< 500 \mu A$ )
- Under voltage lockout with hysteresis
- Output state completely defined for all supply and input conditions
- Interchangeable with UC1844 and UC1845 series for improved operation
- 500kHz Oscillator operation  
250kHz Output operation

## DESCRIPTION

The IP1844 and IP1845 series of switching regulator control circuits contain all the functions necessary to implement off-line, current mode switching regulators, using a minimum number of external parts.

Functions included are voltage reference, error amplifier, current sense comparator, oscillator, totem-pole output driver and under-voltage lockout circuitry. In addition there is a toggle flip-flop which blanks the output on every second clock pulse, thereby ensuring that the duty cycle never exceeds 50%.

Although pin compatible with the UC1844 and UC1845 series, SEMELAB has incorporated several improvements in the IP1844 and IP1845 series allowing tighter and more complete specification of electrical performance .

## BLOCK DIAGRAM

## RECOMMENDED OPERATING CONDITIONS

|          |                                     |                         |
|----------|-------------------------------------|-------------------------|
| $V_{CC}$ | Supply Voltage                      | $\leq 30V$              |
| $I_O$    | Output Current                      | 0 to $\pm 200mA$        |
|          | Analog Inputs (pins 2 and 3)        | $-0.3V$ to $3V$         |
|          | Error Amp Output Sink Current       | 0 to $2mA$              |
|          | Operating Ambient Temperature Range | $-55$ to $125^{\circ}C$ |
|          |                                     | $-25$ to $85^{\circ}C$  |
|          |                                     | 0 to $70^{\circ}C$      |

**NOTES**

1. Test Conditions unless otherwise stated:

$V_{CC} = 15\text{V}^*$ ,  $R_T = 10\text{k}\Omega$ ,  $C_T = 3.3\text{nF}$ ,  $f = 52\text{kHz}$ .

\*Adjust  $V_{CC}$  above start threshold before setting at required level.

All specifications apply over the full operating temperature range unless otherwise stated. (See Ordering Information for further details).

### NOTES

1. Test Conditions unless otherwise stated:

$V_{CC} = 15V^*$ ,  $R_T = 10k\Omega$ ,  $C_T = 3.3nF$ ,  $f = 52kHz$ .

\*Adjust  $V_{CC}$  above start threshold before setting at required level.

2. Parameter measured at trip point of latch with

$V_{PIN2} = 0V$

3. Gain defined as:

$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}}$$

$$0 \leq V_{PIN3} \leq 0.8$$

All specifications apply over the full operating temperature range unless otherwise stated.

(See Ordering Information for further details).

## APPLICATIONS INFORMATION

### Oscillator Waveforms and Maximum Duty Cycle

Oscillator timing capacitor  $C_T$  is charged by  $V_{REF}$  through  $R_T$  and discharged by an internal current source. During the discharge time, the internal clock signal blanks the output to the low state. Selection of  $R_T$  and  $C_T$  therefore determines both oscillator frequency and maximum duty cycle.

Charge and discharge times are determined by the formulae:

$$t_c \approx 0.55 R_T C_T$$

$$t_d \approx R_T C_T \ln \left( \frac{.0063 R_T - 2.3}{.0063 - 4} \right)$$

$$\text{Resultant frequency } f = \frac{1}{(t_c + t_d)}$$

For  $R_T > 5k\Omega$ ,

$$\text{Resultant frequency } f \approx \frac{1.8}{(R_T C_T)}$$

## Open-Loop Laboratory Test Fixture

## TYPICAL PERFORMANCE CHARACTERISTICS

The graph shows the relationship between collector current  $I_C$  (mA) and collector-emitter voltage  $V_{CE}$  (V). The load line is a straight line with a negative slope, intersecting the  $V_{CE}$  axis at 20V and the  $I_C$  axis at 10mA. The Q-point is marked with a black dot at  $V_{CE} = 10V$  and  $I_C = 5mA$ . Arrows indicate the signal swing around the Q-point.
