■ TERMINAL DESCRIPTION

NO.	SYMBOL	F U N C T I O N
1~50	SEG ₁ ~ SEG ₅₀	LCD Segment Output Terminals
51	OSC ₁	Oscillation Terminals : External resistance is connected to these terminals.
52	OSC ₂	
53	V _{DD}	Power Supply (+5V)
54	V _{SS}	Power Supply (0V)
55	V _{LCD}	Power Supply for LCD Driving The relation : $V_{DD} - V_{LCD} \geq 1.3V_{DD}$, $V_{LCD} \geq V_{SS}$ must be maintained.
56	CE	Chip Enable Signal Input Terminal : "H" : LCD display data and mode setting data input "L" : Disable Fall Edge : LCD display data latch
57	SCL	Serial Data Transmission Clock Input Terminal : LCD display and Mode setting data are input synchronized SCL clock signal rise edge.
58	DATA	Serial Data Input Terminal Data input timing : SCL clock rise edge
59	MODE	Data or Mode Select Terminal "H" : Data input mode "L" : LCD display data input mode (refer the mode setting table for mode setting contents)
60	TNH	Display-Off Control Terminal : When display goes to off, the display data in the shift- register is retained. "H" : Display-On "L" : Display-Off
61~64	COM ₄ ~COM ₁	LCD Common Output Terminals

FUNCTIONAL DESCRIPTION

(1) Operation of each block

(1-1) Oscillation Circuit :

The oscillation circuit operate by connecting external resistance (capacitance is incorporated).

This circuit provides the clock signal to both common and segment drivers.

(1-2) Divider Circuit

This circuit divides the oscillating signal to generate the common and segment timing.

(1-3) Shift-Register

When the CE terminal is "H" (Enable mode), the display data is transferred to the shift-register synchronized by the shift clock on the SCL terminal.

(1-4) Latch Circuit and Segment Driver

When the CE signal falling, the display data is latched, and the data controls the segment signal of display-on/off.

(2) Data Input Format

(2-1) Input Data Correspond to Segment Status

The "H" input data correspond to segment "ON" and "L" correspond to "OFF".

Data Dxxx	Segment Status
"H"	ON
"L"	OFF

(2-2) Write to Shift-register

Write to shift-register performs Mode setting data writing and LCD display data writing.

Example 1 (Mode 1): Write to Shift-register 1 (1 to 50-bit)

Example 2 (Mode 2): Write to Shift-register 2 (51 to 100-bit)

Example 3(Mode 3): Write to Shift-register 3(101 to 150-bit)

Example 4(Mode 4): Write to Shift-register 4(151 to 200-bit)

Example 5(Mode 5): Write to Shift-register 5(1 to 200-bit)

(2-3)Mode Setting

Transferd register selection and all clear of the shift register are performed by writing 4-bit code shown below to the decoder in CE ="H" and MODE ="H" state.

< Input Timing Chart >

< Mode Setting Table >

CE Terminal	MODE Terminal	DATA Terminal D ₃ D ₂ D ₁ D ₀	MODE # Data (HEX)	Mode Set Up
"H"	"H"	0 0 0 1	(01 _H)	Select the shift-register 1
		0 0 1 0	(02 _H)	Select the shift-register 2
		0 0 1 1	(03 _H)	Select the shift-register 3
		0 1 0 0	(04 _H)	Select the shift-register 4
		0 1 0 1	(05 _H)	Select the all shift-register (1 to 4)
		1 1 1 1	(0F _H)	All shift-register is "L"

Note) The internal decoder is data through type. Therefore, the 8 bits data also can write though only 4 bits data from the CE falling are validated.

(2-4)Block Data and Whole Data transfer

a.Block Data(50-bit) transfer

In this mode, each 50 bits data block send to the each register.

Data Block 1 : from SEG₁ of COM₁ to SEG₁₃ of COM₂

Data Block 2 : from SEG₁₃ of COM₃ to SEG₂₅ of COM₄

Data Block 3 : from SEG₂₆ of COM₁ to SEG₃₈ of COM₂

Data Block 4 : from SEG₃₈ of COM₃ to SEG₅₀ of COM₄

b.Whole Data(200-bit) transfer

from shift-register 1 to shift-register 4

APPLICATION CIRCUIT

(Note) The internal display data is undefined when V_{DD} is just turned on.

To avoid the meaningless display, please keep the INH terminal at "L" until proper display data has been transferred.

In order to set the initial condition, 200-bit blank data or the first 200-bit data to be displayed should be transferred.
