

K4G323222A

CMOS SGRAM

# 32Mbit SGRAM

*512K x 32bit x 2 Banks*  
*Synchronous Graphic RAM*  
*LVTTL*

Revision 1.3

December 2000

Samsung Electronics reserves the right to change products or specification without notice.

Rev. 1.3 (Dec. 2000)

**Revision History****Revision 1.3 (December 12, 2000)**

- Removed WPB(Write Per Bit) function.

**Revision 1.2 (August 1, 2000)**

- Removed K4G323222A-40
- Changed tSH of K4G323222A from 0.7ns to 1.0ns

**Revision 1.1 (June 27, 2000)**

- Changed ICC5 of K4G323222A-40/45/50/60/70 :Refer to "DC Characteristics table" on page 6.

**Revision 1.0 (June 07, 2000)**

- Removed K4G323222A-55 and add K4G323222A-70

**Revision 0.3 (March 06, 2000)**

- **For -60/70 devices, tRD<sub>L</sub> can be programmed as 1CLK if Auto-Precharge is not used in the design**
- Changed tCH/tCL of K4G323222A-60 from 2ns to 2.5ns

**Revision 0.0 (January 14, 2000) - Target Spec**

- Define target spec

# K4G323222A

# CMOS SGRAM

## 512K x 32Bit x 2 Banks Synchronous Graphic RAM

### FEATURES

- 3.3V power supply
- LVTTTL compatible with multiplexed address
- Dual bank operation
- MRS cycle with address key programs
  - CAS Latency (2, 3)
  - Burst Length (1, 2, 4, 8 & full page)
  - Burst Type (Sequential & Interleave)
- All inputs are sampled at the positive going edge of the system clock
- Burst Read Single-bit Write operation
- DQM 0-3 for byte masking
- Auto & self refresh
- 32ms refresh period (2K cycle)
- 100 Pin PQFP, TQFP (14 x 20 mm)

### Graphics Features

- SMRS cycle.
  - Load color register
- Block Write(8 Columns)

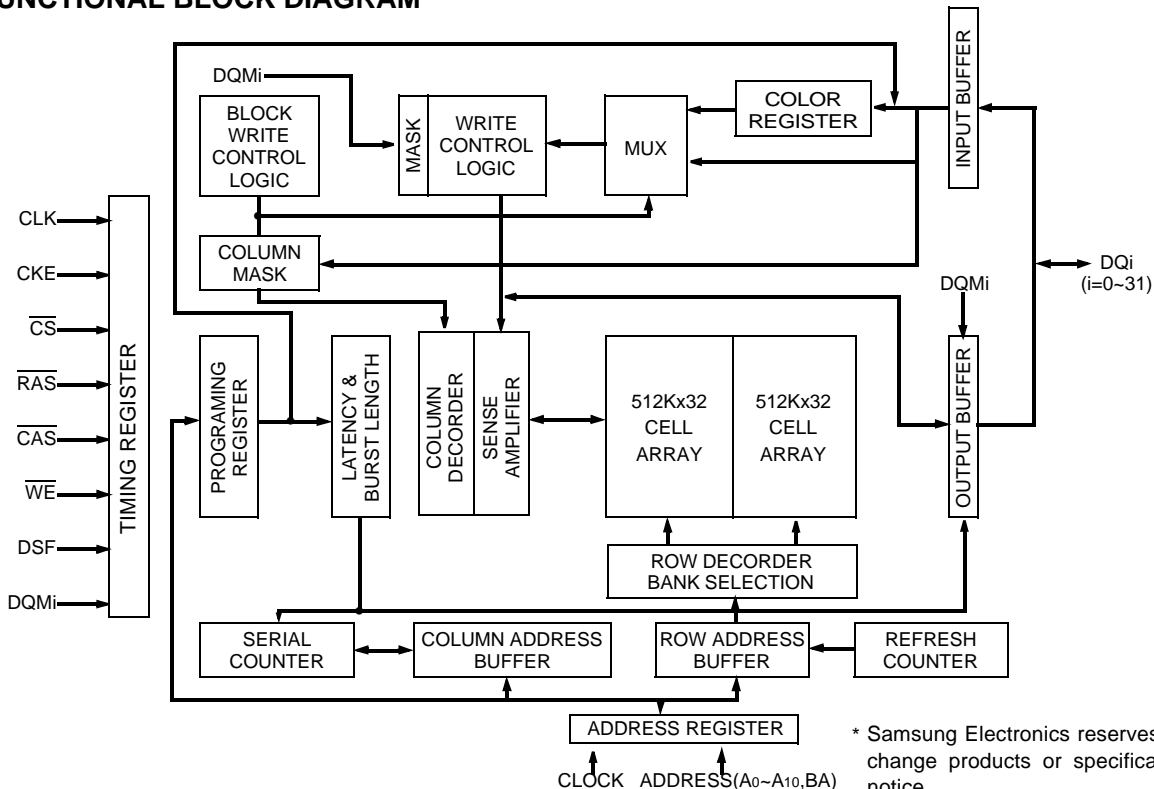

### GENERAL DESCRIPTION

The K4G323222A is 33,554,432 bits synchronous high data rate Dynamic RAM organized as 2 x 524,288 words by 32 bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous design allows precise cycle control with the use of system clock. I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable burst length, and programmable latencies allows the same device to be useful for a variety of high bandwidth, high performance memory system applications. 8 columns block write improves performance in graphics systems.

### ORDERING INFORMATION

Part NO.	Max Freq.	Interface	Package
K4G323222A-PC/L45	222MHz	LVTTTL	100 PQFP
K4G323222A-PC/L50	200MHz		
K4G323222A-PC/L7C	133MHz@CL2		
K4G323222A-PC/L60	166MHz		
K4G323222A-PC/L70	143MHz	LVTTTL	100 TQFP
K4G323222A-QC/L45	222MHz		
K4G323222A-QC/L50	200MHz		
K4G323222A-QC/L7C	133MHz@CL2		
K4G323222A-QC/L60	166MHz		
K4G323222A-QC/L70	143MHz		

### FUNCTIONAL BLOCK DIAGRAM

## PIN CONFIGURATION (TOP VIEW)

\*PQFP (Height = 3.0mmMAX)  
TQFP (Height = 1.2mmMAX)

## PIN CONFIGURATION DESCRIPTION

PIN	NAME	INPUT FUNCTION
CLK	<i>System Clock</i>	Active on the positive going edge to sample all inputs.
$\overline{\text{CS}}$	<i>Chip Select</i>	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM <sub>i</sub>
CKE	<i>Clock Enable</i>	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one clock + t <sub>SS</sub> prior to new command. Disable input buffers for power down in standby.
A0 ~ A10	<i>Address</i>	Row / Column addresses are multiplexed on the same pins. Row address : RA <sub>0</sub> ~ RA <sub>10</sub> , Column address : CA <sub>0</sub> ~ CA <sub>7</sub>
BA	<i>Bank Select Address</i>	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
$\overline{\text{RAS}}$	<i>Row Address Strobe</i>	Latches row addresses on the positive going edge of the CLK with $\overline{\text{RAS}}$ low. Enables row access & precharge.
$\overline{\text{CAS}}$	<i>Column Address Strobe</i>	Latches column addresses on the positive going edge of the CLK with $\overline{\text{CAS}}$ low. Enables column access.
$\overline{\text{WE}}$	<i>Write Enable</i>	Enables write operation and Row precharge.
DQM <sub>i</sub>	<i>Data Input/Output Mask</i>	Makes data output Hi-Z, t <sub>SHZ</sub> after the clock and masks the output. Blocks data input when DQM active.(Byte Masking)
DQ <sub>i</sub>	<i>Data Input/Output</i>	Data inputs/outputs are multiplexed on the same pins.
DSF	<i>Define Special Function</i>	block write and special mode register set.
VDD/VSS	<i>Power Supply /Ground</i>	Power Supply : +3.3V±0.3V/Ground
VDDQ/VSSQ	<i>Data Output Power /Ground</i>	Provide isolated Power/Ground to DQs for improved noise immunity.
N.C	<i>No Connection</i>	

**ABSOLUTE MAXIMUM RATINGS**(Voltage referenced to Vss)

Parameter	Symbol	Value	Unit
Voltage on any pin relative to Vss	VIN, VOUT	-1.0 ~ 4.6	V
Voltage on VDD supply relative to Vss	VDD, VDDQ	-1.0 ~ 4.6	V
Storage temperature	TSTG	-55 ~ +150	°C
Power dissipation	Pd	1	W
Short circuit current	Ios	50	mA

**Note** : Permanent device damage may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded.  
Functional operation should be restricted to recommended operating condition.  
Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

**DC OPERATING CONDITIONS**

Recommended operating conditions (Voltage referenced to Vss = 0V)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Supply voltage	VDD, VDDQ	3.0	3.3	3.6	V	5
Input high voltage	VIH	2.0	3.0	VDDQ+0.3	V	1
Input low voltage	VIL	-0.3	0	0.8	V	2
Output high voltage	VOH	2.4	-	-	V	IOH = -2mA
Output low voltage	VOL	-	-	0.4	V	IOL = 2mA
Input leakage current	ILI	-10	-	10	uA	3
Output leakage current	ILO	-10	-	10	uA	4
Output Loading Condition	see figure 1					

**Note** : 1. VIH (max) = 5.6V AC. The overshoot voltage duration is  $\leq 3$ ns.  
2. VIL (min) = -2.0V AC. The undershoot voltage duration is  $\leq 3$ ns.  
3. Any input  $0V \leq V_{IN} \leq V_{DDQ}$ .  
Input leakage currents include HI-Z output leakage for all bi-directional buffers with Tri-State outputs.  
4. Dout is disabled,  $0V \leq V_{OUT} \leq V_{DD}$ .  
5. The VDD condition of K4G323222A-45/50/7C/60 is 3.135V~3.6V.

**CAPACITANCE** (VDD/VDDQ = 3.3V, TA = 23°C, f = 1MHz)

Pin	Symbol	Min	Max	Unit
Clock	CCLK	-	4.0	pF
RAS, CAS, WE, CS, CE, DQM <sub>i</sub> , DSF	CIN	-	4.0	pF
Address	CADD	-	4.0	pF
DQ <sub>i</sub>	COUT	-	5.0	pF

**DECOUPLING CAPACITANCE GUIDE LINE**

Recommended decoupling capacitance added to power line at board.

Parameter	Symbol	Value	Unit
Decoupling Capacitance between VDD and Vss	CDC1	0.1 + 0.01	uF
Decoupling Capacitance between VDDQ and VssQ	CDC2	0.1 + 0.01	uF

**Note** : 1. VDD and VDDQ pins are separated each other.  
All VDD pins are connected in chip. All VDDQ pins are connected in chip.  
2. Vss and VssQ pins are separated each other  
All Vss pins are connected in chip. All VssQ pins are connected in chip.

**DC CHARACTERISTICS**

(Recommended operating condition unless otherwise noted, T<sub>A</sub> = 0 to 70°C, V<sub>IH(min)</sub>/V<sub>IL(max)</sub>=2.0V/0.8V)

Parameter	Symbol	Test Condition	CAS Latency	Speed					Unit	Note
				-45	-50	-7C	-60	-70		
Operating Current (One Bank Active)	ICC1	Burst Length =1 t <sub>RC</sub> ≥ t <sub>RC(min)</sub> , t <sub>CC</sub> ≥ t <sub>CC(min)</sub> , I <sub>o</sub> = 0mA	3	220	200	-	180	160	mA	2
			2	150	150	200	150	150		
Precharge Standby Current in power-down mode	ICC2P	CKE ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = 15ns	2					mA		
	ICC2PS	CKE & CLK ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = ∞	2							
Precharge Standby Current in non power-down mode	ICC2N	CKE ≥ V <sub>IH(min)</sub> , CS ≥ V <sub>IH(min)</sub> , t <sub>CC</sub> = 15ns Input signals are changed one time during 30ns	30					mA		
	ICC2NS	CKE ≥ V <sub>IH(min)</sub> , CLK ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = ∞ Input signals are stable	15							
Active Standby Current in power-down mode	ICC3P	CKE ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = 15ns	4					mA		
	ICC3PS	CKE ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = ∞	4							
Active Standby Current in non power-down mode (One Bank Active)	ICC3N	CKE ≥ V <sub>IH(min)</sub> , CS ≥ V <sub>IH(min)</sub> , t <sub>CC</sub> = 15ns Input signals are changed one time during 30ns	50					mA		
	ICC3NS	CKE ≥ V <sub>IH(min)</sub> , CLK ≤ V <sub>IL(max)</sub> , t <sub>CC</sub> = ∞ Input signals are stable	30							
Operating Current (Burst Mode)	ICC4	I <sub>o</sub> = 0 mA, Page Burst All bank Activated, t <sub>CCD</sub> = t <sub>CCD(min)</sub>	3	310	290	-	260	230	mA	2
			2	160	160	290	160	160		
Refresh Current	ICC5	t <sub>RC</sub> ≥ t <sub>RC(min)</sub>	3	260	240	-	220	200	mA	3
			2	190	190	240	190	190		
Self Refresh Current	ICC6	CKE ≤ 0.2V	2					mA	4	
			450							uA
Operating Current (One Bank Block Write)	ICC7	t <sub>CC</sub> ≥ t <sub>CC(min)</sub> , I <sub>o</sub> =0mA, t <sub>BWC(min)</sub>	250	230	230	200	170	mA		

- Note :**
1. Unless otherwise notes, Input level is CMOS(V<sub>IH</sub>/V<sub>IL</sub>=V<sub>DDQ</sub>/V<sub>SSQ</sub>) in LVTTTL.
  2. Measured with outputs open. Addresses are changed only one time during t<sub>CC(min)</sub>.
  3. Refresh period is 32ms. Addresses are changed only one time during t<sub>CC(min)</sub>.
  4. K4G323222A-C\*
  5. K4G323222A-L\* : Low Power version

# K4G323222A

# CMOS SGRAM

## AC OPERATING TEST CONDITIONS (VDD = 3.3V±0.3V, TA = 0 to 70°C)

Parameter	Value	Unit
Input levels (Vih/Vil)	2.4 / 0.4	V
Input timing measurement reference level	1.4	V
Input rise and fall time	tr/tr = 1 / 1	ns
Output timing measurement reference level	1.4	V
Output load condition	See Fig. 2	

(Fig. 1) DC Output Load Circuit

(Fig. 2) AC Output Load Circuit

**Note** : 1. The VDD condition of K4G323222A-45/50/7C/60 is 3.135V~3.6V.

## OPERATING AC PARAMETER

(AC operating conditions unless otherwise noted)

Parameter	Symbol	Version										Unit	Note
		-45		-50		-7C		-60		-70			
CAS Latency	CL	3	2	3	2	-	2	3	2	3	2	CLK	
CLK cycle time	tCC(min)	4.5	10	5	10	-	7.5	6	10	7	10	ns	
Row active to row active delay	tRRD(min)	2										CLK	1
RAS to CAS delay	tRCD(min)	4	2	3	2	-	2	3	2	3	2	CLK	1
Row precharge time	tRP(min)	4	2	3	2	-	2	3	2	3	2	CLK	1
Row active time	tRAS(min)	9	5	8	5	-	6	7	5	7	5	CLK	1
	tRAS(max)	100										us	
Row cycle time	tRC(min)	13	7	11	7	-	8	10	7	10	7	CLK	1
Last data in to row precharge	tRD(min)	2										CLK	2,5
Last data in to new col.address delay	tCDL(min)	1										CLK	2
Last data in to burst stop	tBDL(min)	1										CLK	2
Col. address to col. address delay	tCCD(min)	1										CLK	
Block Write data-in to PRE command	tBPL(min)	2										CLK	
Block write cycle time	tBWC(min)	1										CLK	3
Mode Register Set cycle time	tMRS(min)	1										CLK	
Number of valid output data	CAS Latency=3	2										ea	4
	CAS Latency=2	1											

**Note** : 1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer. Refer to the following ns-unit based AC table.

Parameter	Symbol	Version					Unit
		-45	-50	-7C	-60	-70	
Row active to row active delay	tRRD(min)	9	10	15	12	14	ns
RAS to CAS delay	tRCD(min)	18	15	15	18	20	ns
Row precharge time	tRP(min)	18	15	15	18	20	ns
Row active time	tRAS(min)	40.5	40	45	42	49	ns
	tRAS(max)	100					us
Row cycle time	tRC(min)	58.5	55	60	60	70	ns

2. Minimum delay is required to complete write.
3. This parameter means minimum CAS to CAS delay at block write cycle only.
4. In case of row precharge interrupt, auto precharge and read burst stop.
5. For -60/70 devices, tRDL can be programmed as 1CLK if Auto-Precharge is not used in the design

### AC CHARACTERISTICS (AC operating conditions unless otherwise noted)

Parameter		Symbol	-45		-50		-7C		-60		-70		Unit	Note
			Min	Max	Min	Max	Min	Max	Min	Max	Min	Max		
CLK cycle time	CAS Latency=3	tcc	4.5	1000	5	1000	-	1000	6	1000	7	1000	ns	1
	CAS Latency=2		10		10		7.5		10		10			
CLK to valid output delay	CAS Latency=3	tsAC	-	4	-	4.5	-	-	-	5.5	-	5.5	ns	1, 2
	CAS Latency=2		-	6	-	6	-	6	-	6	-	6		
Output data hold time		toH	2	-	2	-	2	-	2	-	2	-	ns	2
CLK high pulse width	CAS Latency=3	tCH	1.75	-	2	-	-	-	2.5	-	3	-	ns	3
	CAS Latency=2		3	-	3	-	2	-	3	-	3	-		
CLK low pulse width	CAS Latency=3	tCL	1.75	-	2	-	-	-	2.5	-	3	-	ns	3
	CAS Latency=2		3	-	3	-	2	-	3	-	3	-		
Input setup time	CAS Latency=3	tSS	1.2	-	1.5	-	-	-	1.5	-	1.75	-	ns	3
	CAS Latency=2		2.5	-	2.5	-	1.5	-	2.5	-	2.5	-		
Input hold time		tSH	1	-	1	-	1	-	1	-	1	-	ns	3
CLK to output in Low-Z		tSLZ	1	-	1	-	1	-	1	-	1	-	ns	2
CLK to output in Hi-Z	CAS latency=3	tSHZ	-	4	-	4.5	-	-	-	5.5	-	5.5	ns	-
	CAS latency=2		-	6	-	6	-	6	-	6	-	6		

- Note :**
1. Parameters depend on programmed CAS latency.
  2. If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
  3. Assumed input rise and fall time (tr & tf)=1ns.  
If tr & tf is longer than 1ns, transient time compensation should be considered, i.e., [(tr + tf)/2-1]ns should be added to the parameter.

SIMPLIFIED TRUTH TABLE

COMMAND		CKEn-1	CKEn	$\overline{CS}$	$\overline{RAS}$	$\overline{CAS}$	$\overline{WE}$	DSF	DQM	BA	A8	A10,A9, A7~A0	Note	
Register	Mode Register Set	H	X	L	L	L	L	L	X		OP CODE		1, 2	
	Special Mode Register Set							H					1,2,7

					H	X	X	X						
	Exit		L	H	L	V	V	V	V	X	X			
					H	X	X	X					X	
DQM		H		X						V	X		8	
No Operation Command		H	X	L	H	H	H	X	X		X			
				H	X	X	X							

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

**Note** : 1. OP Code : Operand Code

A0 ~ A10, BA : Program keys. (@MRS)

A6 : LCR select. (@SMRS)

Color register exists only one per DQi which both banks share.

Color is loaded into chip through DQ pin.

2. MRS can be issued only at both banks precharge state.

SMRS can be issued only if DQ's are idle.

A new command can be issued at the next clock of MRS/SMRS.

**SIMPLIFIED TRUTH TABLE**

- 3. Auto refresh functions as same as CBR refresh of DRAM.  
 The automatical precharge without Row precharge command is meant by "Auto".  
 Auto/Self refresh can be issued only at both precharge state.
- 4. BA : Bank select address.  
 If "Low" at read, (block) write, Row active and precharge, bank A is selected.  
 If "High" at read, (block) write, Row active and precharge, bank B is selected.  
 If A8 is "High" at Row precharge, BA is ignored and both banks are selected.
- 5. During burst read or write with auto precharge, new read/(block) write command cannot be issued.  
 Another bank read/(block) write command can be issued at tRP after the end of burst.
- 6. Burst stop command is valid only at full page burst length.
- 7. DQM sampled at positive going edge of a CLK.  
 masks the data-in at the very CLK(Write DQM latency is 0)  
 but makes Hi-Z state the data-out of 2 CLK cycles after.(Read DQM latency is 2)
- 8. Graphic features added to SDRAM's original features.  
 If DSF is tied to low, graphic functions are disabled and chip operates as a 32M SDRAM with 32 DQ's.

**SGRAM vs SDRAM**

Function	MRS		Write	
DSF	L	H	L	H
SGRAM Function	MRS	SMRS	Normal Write	Block Write

*If DSF is low, SGRAM functionality is identical to SDRAM functionality.*

SGRAM can be used as an unified memory by the appropriate DSF control  
 --> SGRAM=Graphic Memory + Main Memory

**MODE REGISTER FIELD TABLE TO PROGRAM MODES**

**Register Programmed with MRS**

Address	BA	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0

Function	X					LC	0	X				

Load Color	
A6	Function
0	Disable
1	Enable

**POWER UP SEQUENCE**

**SGRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.**

1. Apply power and start clock. Must maintain CKE= "H", DQM= "H" and the other pins are NOP condition at the inputs.
2. Maintain stable power, stable clock and NOP input condition for a minimum of 200us.
3. Issue precharge commands for all banks of the devices.
4. Issue 2 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.  
cf.) Sequence of 4 & 5 may be changed.

The device is now ready for normal operation.

- Note :**
1. RFU(Reserved for Future Use) should stay "0" during MRS cycle.
  2. If A9 is high during MRS cycle, "Burst Read Single Bit Write" function will be enabled.
  3. The full column burst(256bit) is available only at Sequential mode of burst type.

**BURST SEQUENCE (BURST LENGTH = 4)**

Initial address		Sequential				Interleave			
A1	A0								
0	0	0	1	2	3	0	1	2	3
0	1	1	2	3	0	1	0	3	2
1	0	2	3	0	1	2	3	0	1

## DEVICE OPERATIONS

### CLOCK (CLK)

The clock input is used as the reference for all SGRAM operations. All operations are synchronized to the positive going edge of the clock. The clock transitions must be monotonic between  $V_{IL}$  and  $V_{IH}$ . During operation with CKE high all inputs are assumed to be in a valid state (low or high) for the duration of set-up and hold time around positive edge of the clock for proper functionality and ICC specifications.

### CLOCK ENABLE (CKE)

The clock enable (CKE) gates the clock onto SGRAM. If CKE goes low synchronously with clock (set-up and hold time are the same as other inputs), the internal clock is suspended from the next clock cycle and the state of output and burst address is frozen as long as the CKE remains low. All other inputs are ignored from the next clock cycle after CKE goes low. When both banks are in the idle state and CKE goes low synchronously with clock, the SGRAM enters the power down mode from the next clock cycle. The SGRAM remains in the power down mode ignoring the other inputs as long as CKE remains low. The power down exit is synchronous as the internal clock is suspended. When CKE goes high at least "t<sub>SS</sub> + 1CLOCK" before the high going edge of the clock, then the SGRAM becomes active from the same clock edge accepting all the input commands.

### BANK SELECT (BA)

This SGRAM is organized as two independent banks of 524,288 words x 32 bits memory arrays. The BA inputs is latched at the time of assertion of RAS and CAS to select the bank to be used for the operation. When BA is asserted low, bank A is selected. When BA is asserted high, bank B is selected. The bank select BA is latched at bank activate, read, write mode register set and precharge operations.

### ADDRESS INPUT (A0 ~ A10)

The 19 address bits required to decode the 524,288 word locations are multiplexed into 11 address input pins (A0~A10). The 11 bit row address is latched along with RAS and BA during bank activate command. The 8 bit column address is latched along with CAS, WE and BA during read or write command.

### NOP and DEVICE DESELECT

When  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  are high, the SGRAM performs no operation (NOP). NOP does not initiate any new operation, but is needed to complete operations which require more than single clock cycle like bank activate, burst read, auto refresh, etc. The device deselect is also a NOP and is entered by asserting  $\overline{CS}$  high.  $\overline{CS}$  high disables the command decoder so that  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , DSF and all the address inputs are ignored.

### POWER-UP

**SGRAMs must be powered up and initialized in a pre-defined manner to prevent undefined operations.**

1. Power must be applied to both CKE and DQM inputs to pull them high and other pins are NOP condition at the inputs before or along with VDD (and VDDQ) supply. The clock signal must also be asserted at the same time.
2. After VDD reaches the desired voltage, a minimum pause of 200 microseconds is required with inputs in NOP condition.
3. Both banks must be precharged now.
4. Perform a minimum of 2 Auto refresh cycles to stabilize the internal circuitry.
5. Perform a MODE REGISTER SET cycle to program the CAS latency, burst length and burst type as the default value of mode register is undefined.

At the end of one clock cycle from the mode register set cycle, the device is ready for operation.

When the above sequence is used for Power-up, all the outputs will be in high impedance state. The high impedance of outputs is not guaranteed in any other power-up sequence.

cf.) Sequence of 4 & 5 may be changed.

### MODE REGISTER SET (MRS)

The mode register stores the data for controlling the various operating modes of SGRAM. It programs the CAS latency, addressing mode, burst length, test mode and various vendor specific options to make SGRAM useful for variety of different applications. The default value of the mode register is not defined, therefore the mode register must be written after power up to operate the SGRAM. The mode register is written by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  and DSF (The SGRAM should be in active mode with CKE already high prior to writing the mode register). The state of address pins A0 ~ A10 and BA in the same cycle as  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  and DSF going low is the data written in the mode register. One clock cycle is required to complete the write in the mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as both banks are in the idle state. The mode register is divided into various fields depending on functionality. The burst length field uses A0 ~ A2, burst type uses A3, addressing mode uses A4 ~ A6, A7 ~ A8, A10 and BA are used for vendor specific options or test mode. And the write burst length is programmed using A9. A7 ~ A8, A10 and BA must be set to low for normal SGRAM operation. Refer to table for specific codes for various burst length, addressing modes and CAS latencies.

## DEVICE OPERATIONS

### BANK ACTIVATE

The bank activate command is used to select a random row in an idle bank. By asserting low on  $\overline{RAS}$  and  $\overline{CS}$  with desired row and bank addresses, a row access is initiated. The read or write operation can occur after a time delay of  $t_{RCD}(\text{min})$  from the time of bank activation.  $t_{RCD}(\text{min})$  is an internal timing parameter of SGRAM, therefore it is dependent on operating clock frequency. The minimum number of clock cycles required between bank activate and read or write command should be calculated by dividing  $t_{RCD}(\text{min})$  with cycle time of the clock and then rounding off the result to the next higher integer. The SGRAM has two internal banks on the same chip and shares part of the internal circuitry to reduce chip area, therefore it restricts the activation of both banks immediately. Also the noise generated during sensing of each bank of SGRAM is high requiring some time for power supplies to recover before the other bank can be sensed reliably.  $t_{RRD}(\text{min})$  specifies the minimum time required between activating different banks. The number of clock cycles required between different bank activation must be calculated similar to  $t_{RCD}$  specification. The minimum time required for the bank to be active to initiate sensing and restoring the complete row of dynamic cells is determined by  $t_{RAS}(\text{min})$  specification before a precharge command to that active bank can be asserted. The maximum time any bank can be in the active state is determined by  $t_{RAS}(\text{max})$ . The number of cycles for both  $t_{RAS}(\text{min})$  and  $t_{RAS}(\text{max})$  can be calculated similar to  $t_{RCD}$  specification.

### BURST READ

The burst read command is used to access burst of data on consecutive clock cycles from an active row in an active bank. The burst read command is issued by asserting low on  $\overline{CS}$  and  $\overline{CAS}$  with  $\overline{WE}$  being high on the positive edge of the clock. The bank must be active for at least  $t_{RCD}(\text{min})$  before the burst read command is issued. The first output appears  $t_{CAS}$  latency number of clock cycles after the issue of burst read command. The burst length, burst sequence and latency from the burst read command is determined by the mode register which is already programmed. The burst read can be initiated on any column address of the active row. The address wraps around if the initial address does not start from a boundary such that number of outputs from each I/O are equal to the burst length programmed in the mode register. The output goes into high-impedance at the end of the burst, unless a new burst read was initiated to keep the data output gapless. The burst read can be terminated by issuing another burst read or burst write in the same bank or the other active bank or a precharge command to the same bank. The burst stop command is valid only at full page burst length where the output does not go into high impedance at the end of burst and the burst is wrapped around..

### BURST WRITE

The burst write command is similar to burst read command, and is used to write data into the SGRAM on consecutive clock

cycles in adjacent addresses depending on burst length and burst sequence. By asserting low on  $\overline{CS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  with valid column address, a write burst is initiated. The data inputs are provided for the initial address in the same clock cycle as the burst write command. The input buffer is deselected at the end of the burst length, even though the internal writing may not have been completed yet. The writing can not complete to burst length. The burst write can be terminated by issuing a burst read and DQM for blocking data inputs or burst write in the same or the other active bank. The burst stop command is valid only at full page burst length where the writing continues at the end of burst and the burst is wrapped around. The write burst can also be terminated by using DQM for blocking data and precharging the bank "trDL" after the last data input to be written into the active row. See DQM OPERATION also.

### DQM OPERATION

The DQM is used to mask input and output operations. It works similar to  $\overline{OE}$  during read operation and inhibits writing during write operation. The read latency is two cycles from DQM and zero cycle for write, which means DQM masking occurs two cycles later in the read cycle and occurs in the same cycle during write cycle. DQM operation is synchronous with the clock, therefore the masking occurs for a complete cycle. The DQM signal is important during burst interrupts of write with read or precharge in the SGRAM. Due to asynchronous nature of the internal write, the DQM operation is critical to avoid unwanted or incomplete writes when the complete burst write is not required. DQM is also used for device selection, byte selection and bus control in a memory system. DQM0 controls DQ0 to DQ7, DQM1 controls DQ8 to DQ15, DQM2 controls DQ16 to DQ23, DQM3 controls DQ24 to DQ31. DQM masks the DQ's by a byte regardless that the corresponding DQ's are in a state of Pixel masking. Please refer to DQM timing diagram also.

### PRECHARGE

The precharge operation is performed on an active bank by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{WE}$  and A8/AP with valid BA of the bank to be precharged. The precharge command can be asserted anytime after  $t_{RAS}(\text{min})$  is satisfied from the bank activate command in the desired bank. "trP" is defined as the minimum time required to precharge a bank. The minimum number of clock cycles required to complete row precharge is calculated by dividing "trP" with clock cycle time and rounding up to the next higher integer. Care should be taken to make sure that burst write is completed or DQM is used to inhibit writing before precharge command is asserted. The maximum time any bank can be active is specified by  $t_{RAS}(\text{max})$ . Therefore, each bank has to be precharged within  $t_{RAS}(\text{max})$  from the bank activate command. At the end of precharge, the bank enters the idle state and is ready to be activated again.

**DEVICE OPERATIONS (Continued)**

Entry to Power Down, Auto refresh, Self refresh and Mode register Set etc. is possible only when both banks are in idle state.

**AUTO PRECHARGE**

The precharge operation can also be performed by using auto precharge. The SGRAM internally generates the timing to satisfy  $t_{RAS(min)}$  and "tRP" for the programmed burst length and CAS latency. The auto precharge command is issued at the same time as burst read or burst write by asserting high on A8/AP. If burst read or burst write command is issued with low on A8/AP, the bank is left active until a new command is asserted. Once auto precharge command is given, no new commands are possible to that particular bank until the bank achieves idle state.

**BOTH BANKS PRECHARGE**

Both banks can be precharged at the same time by using Precharge all command. Asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ , and  $\overline{WE}$  with high on A8/AP after both banks have satisfied  $t_{RAS(min)}$  requirement, performs precharge on both banks. At the end of tRP after performing precharge all, both banks are in idle state.

**AUTO REFRESH**

The storage cells of SGRAM need to be refreshed every 32ms to maintain data. An auto refresh cycle accomplishes refresh of a single row of storage cells. The internal counter increments automatically on every auto refresh cycle to refresh all the rows. An auto refresh command is issued by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$  and  $\overline{CAS}$  with high on CKE and  $\overline{WE}$ . The auto refresh command can only be asserted with both banks being in idle state and the device is not in power down mode (CKE is high in the previous cycle). The time required to complete the auto refresh operation is specified by "trc(min)". The minimum number of clock cycles required can be calculated by driving "trc" with clock cycle time and then rounding up to the next higher integer. The auto refresh command must be followed by NOP's until the auto refresh operation is completed. Both banks will be in the idle state at the end of auto refresh operation. The auto refresh is the preferred refresh mode when the SGRAM is being used for normal data transactions. The auto refresh cycle can be performed once in 15.6us or a burst of 2048 auto refresh cycles once in 32ms.

**SELF REFRESH**

The self refresh is another refresh mode available in the SGRAM. The self refresh is the preferred refresh mode for data retention and low power operation of SGRAM. In self refresh mode, the SGRAM disables the internal clock and all the input buffers except CKE. The refresh addressing and timing are internally generated to reduce power consumption.

The self refresh mode is entered from all banks idle state by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  and CKE with high on  $\overline{WE}$ . Once the self refresh mode is entered, only CKE state being low matters, all the other inputs including the clock are ignored in order to remain in the self refresh mode.

The self refresh is exited by restarting the external clock and then asserting high on CKE. This must be followed by NOP's for a minimum time of "trc" before the SGRAM reaches idle state to begin normal operation. If the system uses burst auto refresh during normal operation, it is recommended to use burst 2048 auto refresh cycles immediately after exiting self refresh.

**DEFINE SPECIAL FUNCTION(DSF)**

The DSF controls the graphic applications of SGRAM. If DSF is tied to low, SGRAM functions as 512K x 32 x2 Bank SDRAM. SGRAM can be used as a unified memory by the appropriate DSF command. All the graphic function modes can be entered only by setting DSF high when issuing commands which otherwise would be normal SDRAM commands. SDRAM functions such as Write, and WCBR change to SGRAM functions such as Block Write and SWCBR respectively. See the section below for the graphic functions that DSF controls.

**SPECIAL MODE REGISTER SET(SMRS)**

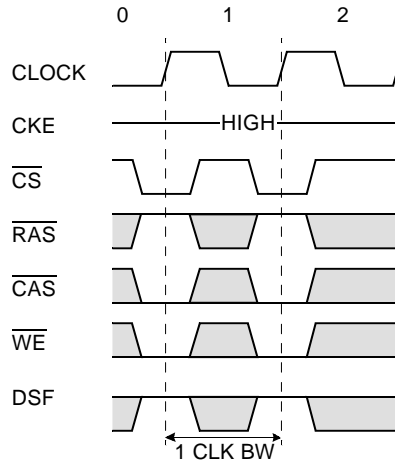

There is special mode registers in SGRAM. it is color register. That usage will be explained in the "BLOCK WRITE" sections. when A6 and DSF goes high in the same cycle as  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  going low, Load Color Register(LCR) process is executed and the color register is filled with color data for associated DQ's through the DQ pins. If A6 is high at SMRS, color cycle is required to complete the write in the color register at LCR. A new command can be issued in the next clock of LCR. SMRS, compared with MRS, can be issued at the active state under the condition that DQ's are idle. As in write operation, SMRS accepts the data needed through DQ pins. Therefore bus contention must be avoided. The more detailed materials can be obtained by referring corresponding timing diagram.

DEVICE OPERATIONS (Continued)

**BLOCK WRITE**

Block write is a feature allowing the simultaneous writing of consecutive 8 columns of data within a RAM device during a single access cycle. During block write the data to be written comes from an internal "color" register and DQ I/O pins are used for independent column selection. The block of column to be written is aligned on 8 column boundaries and is defined by the column address with the 3 LSB's ignored. Write command with DSF=1 enables block write for the associated bank. A write command with DSF=0 enables normal write for the associated bank. The block width is 8 column where column="n" bits for by "n" part. The color register is the same width as the data port of the chip. It is written via a SWCBR where data present on the DQ pin is to be coupled into the internal color register. The color register provides the data masked by the DQ column select, and DQM byte mask. Column data masking (Pixel masking) is provided on an individual column basis for each byte of data. The column mask is driven on the DQ pins during a block write command. The DQ column mask function is segmented on a per bit basis (i.e. DQ[0:7] provides the column mask for data bits[0:7], DQ[8:15] provides the column mask for data bits[8:15], DQ0 masks column[0] for data bits[0:7], DQ9 masks column [1] for data bits [8:15], etc). Block writes are always non-burst, independent of the burst length that has been programmed into the mode register. Back to back block writes are allowed provided that the specified block write cycle time (t<sub>BWC</sub>) is satisfied. DQM masking provides independent data byte masking during block write exactly the same as it does during normal write operations, except that the control is extended to the consecutive 8 columns of the block write.

Timing Diagram to Illustrate t<sub>BWC</sub>

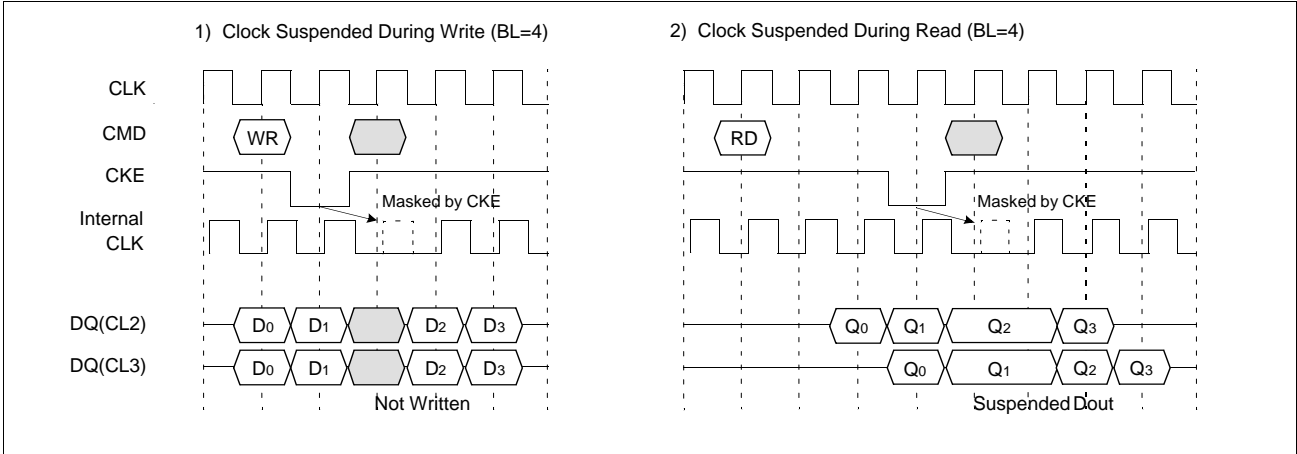

## SUMMARY OF 4M Byte SGRAM BASIC FEATURES AND BENEFITS

Features	512K x 32 x 2 SGRAM	Benefits
Interface	Synchronous	Better interaction between memory and system without wait-state of asynchronous DRAM. High speed vertical and horizontal drawing. High operating frequency allows performance gain for SCROLL, FILL, and BitBLT.
Bank	2 ea	Pseudo-infinite row length by on-chip interleaving operation. Hidden row activation and precharge.
Page Depth / 1 Row	256 bit	High speed vertical and horizontal drawing.
Total Page Depth	2048 bytes	High speed vertical and horizontal drawing.
Burst Length(Read)	1, 2, 4, 8 Full Page	Programmable burst of 1, 2, ,4, 8 and full page transfer per column addresses.
Burst Length(Write)	1, 2, 4, 8 Full Page	Programmable burst of 1, 2, ,4, 8 and full page transfer per column addresses.
	BRSW	Switch to burst length of 1 at write without MRS.
Burst Type	Sequential & Interleave	Compatible with Intel and Motorola CPU based system.
CAS Latency	2, 3	Programmable CAS latency.
Block Write	8 Columns	High speed FILL, CLEAR, Text with color registers. Maximum 32 byte data transfers(e.g. for 8bpp : 32 pixels) with plane and byte masking functions.
Color Register	1 ea.	A and B bank share.
Mask function	DQM0-3	Byte masking(pixel masking for 8bpp system) for data-out/in
	Pixel Mask at Block Write	Byte masking(pixel masking for 8bpp system) for color by DQi

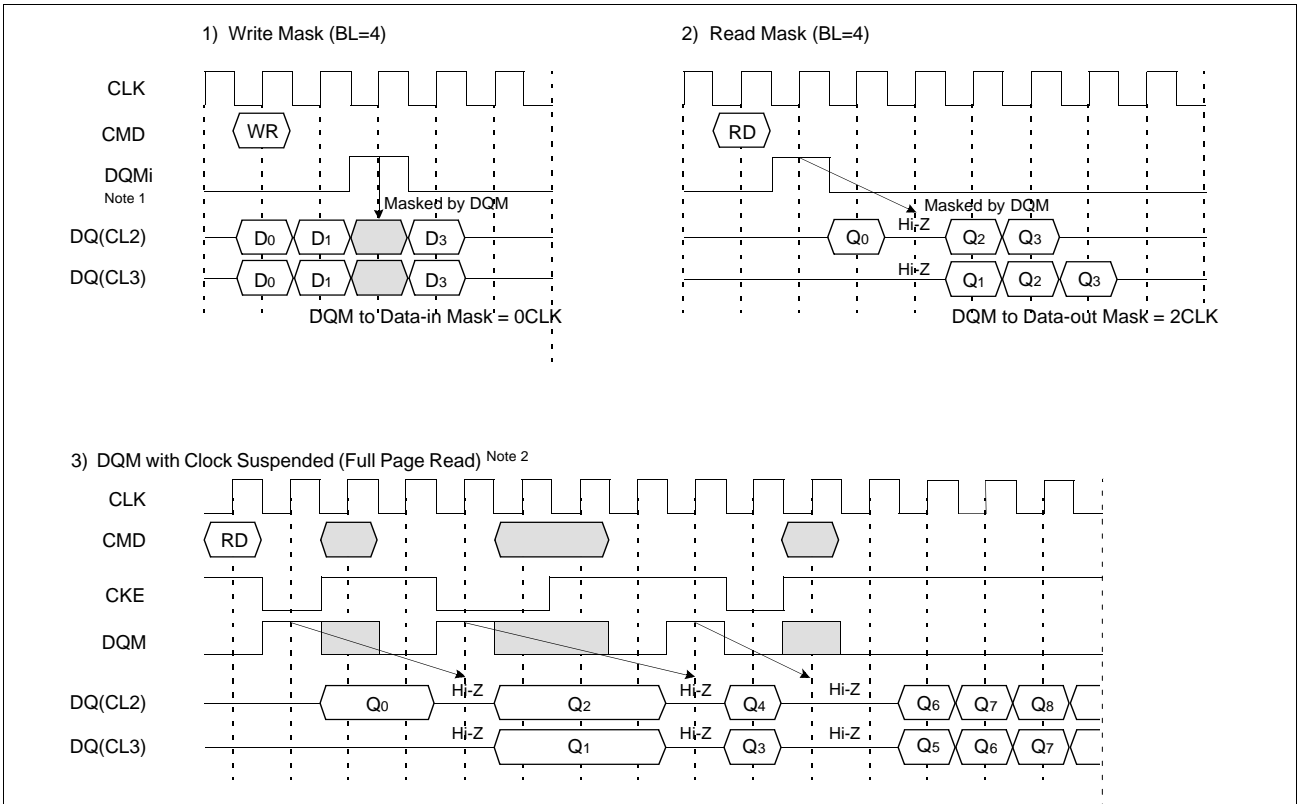

BASIC FEATURE AND FUNCTION DESCRIPTIONS

1. CLOCK Suspend

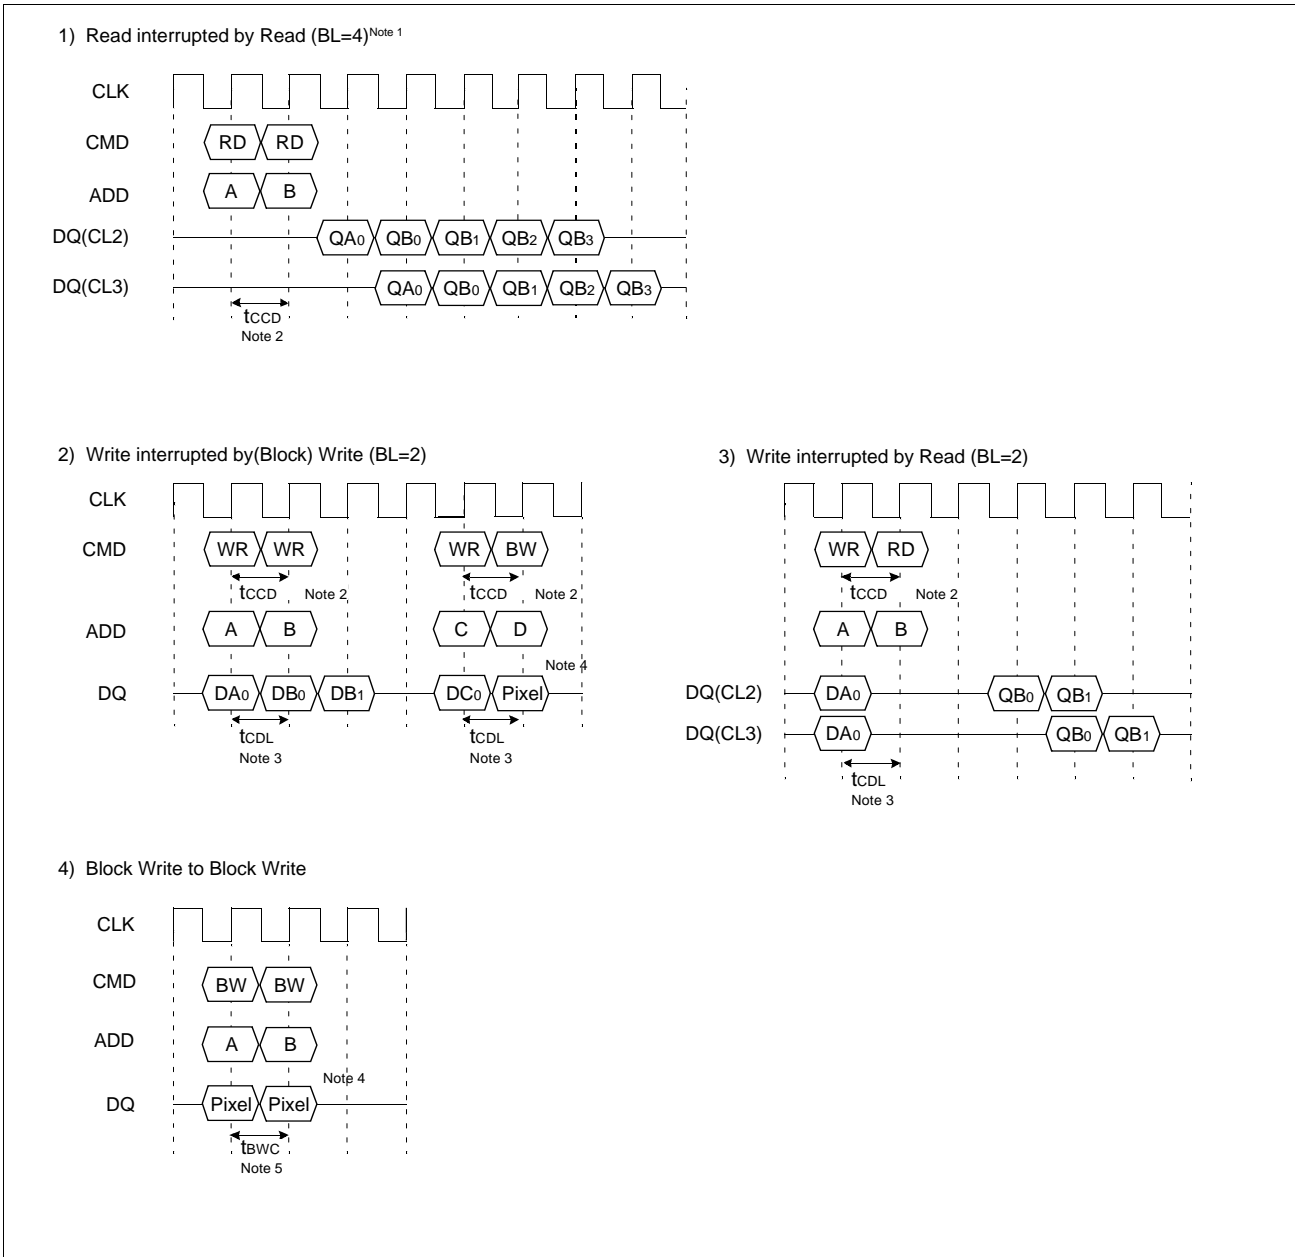

Note : CKE to CLK disable/enable=1 clock

2. DQM Operation

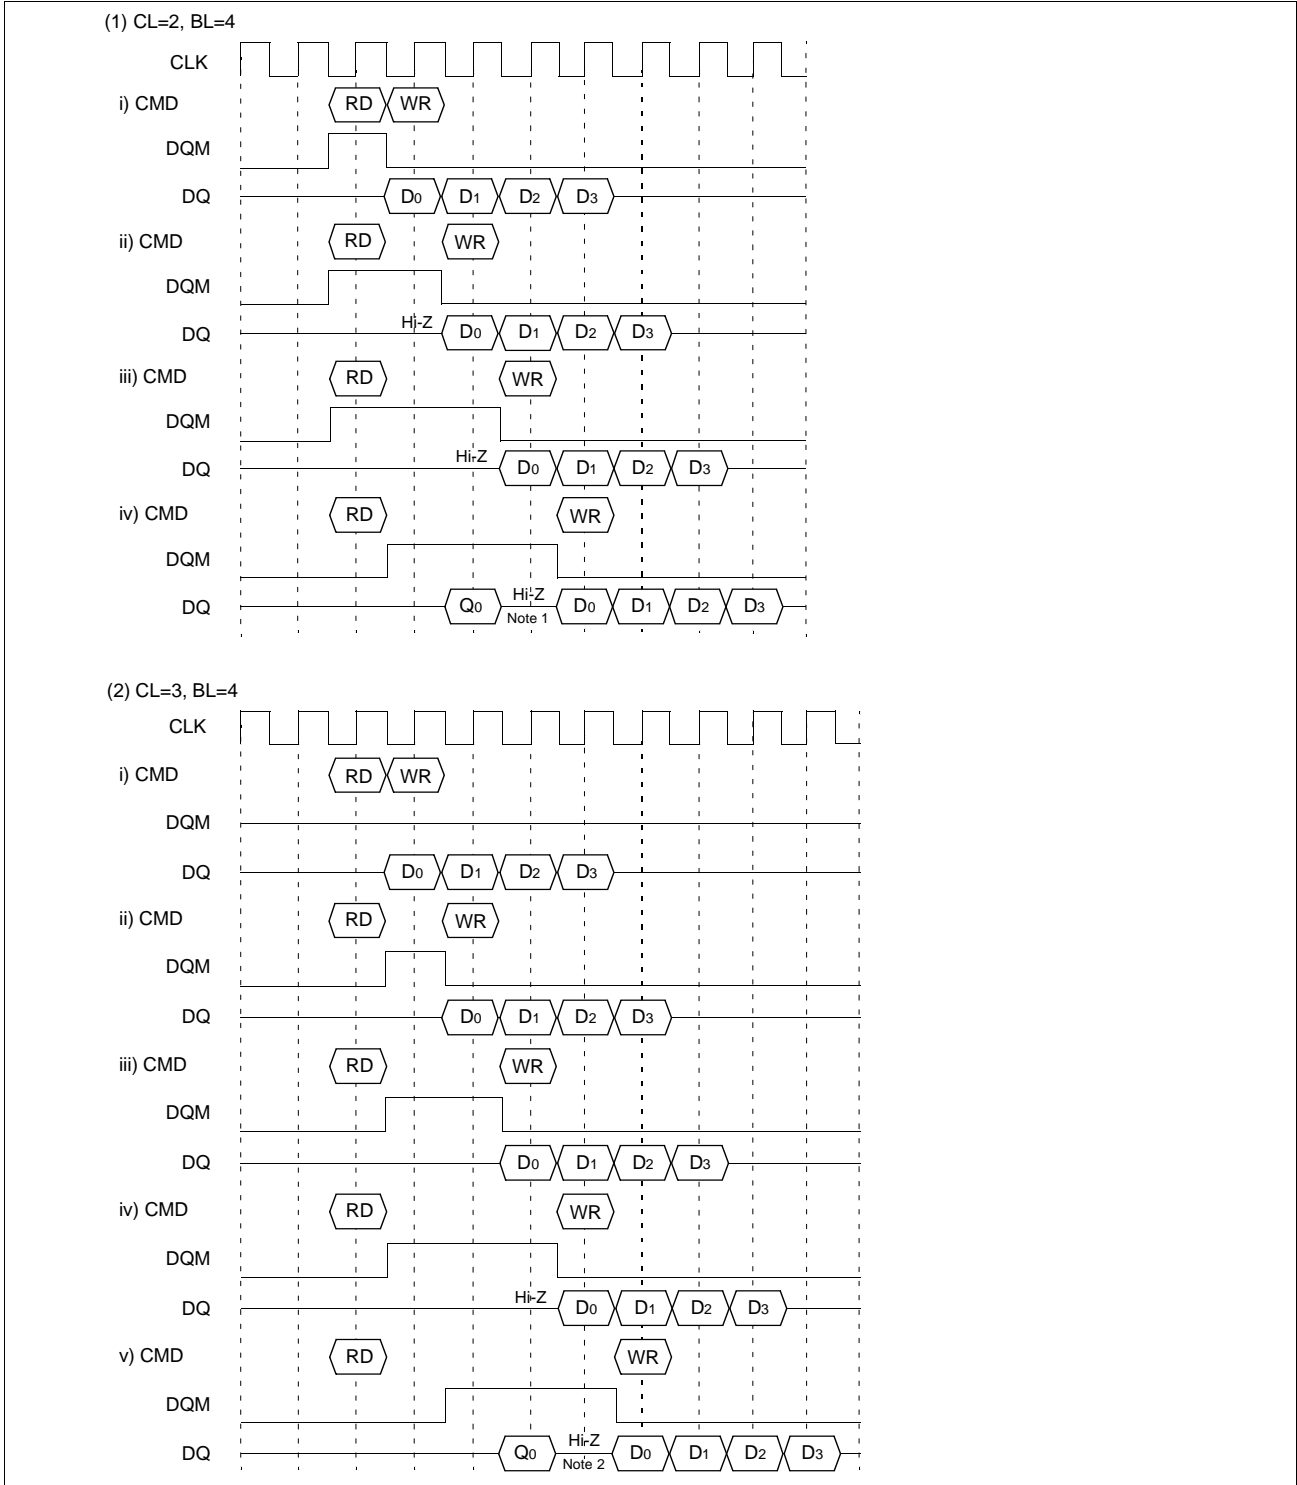

\*Note : 1. There are 4 DQM<sub>i</sub>(i=0-3).  
 Each DQM<sub>i</sub> masks 8 DQ's.(1 Byte, 1 Pixel for 8 bpp)  
 2. DQM makes data out Hi-Z after 2 clocks which should be masked by CKE "L".

3. CAS Interrupt (I)

- \*Note : 1. By " Interrupt ", It is possible to stop burst read/write by external command before the end of burst.  
By "CAS Interrupt", to stop burst read/write by CAS access ; read, write and block write.
- 2. tCCD : CAS to CAS delay. (=1CLK)
- 3. tCDL : Last data in to new column address delay. (=1CLK)
- 4. Pixel : Pixel mask.
- 5. tBWC : Block write minimum cycle time.

4. CAS Interrupt (II) : Read Interrupted by Write & DQM

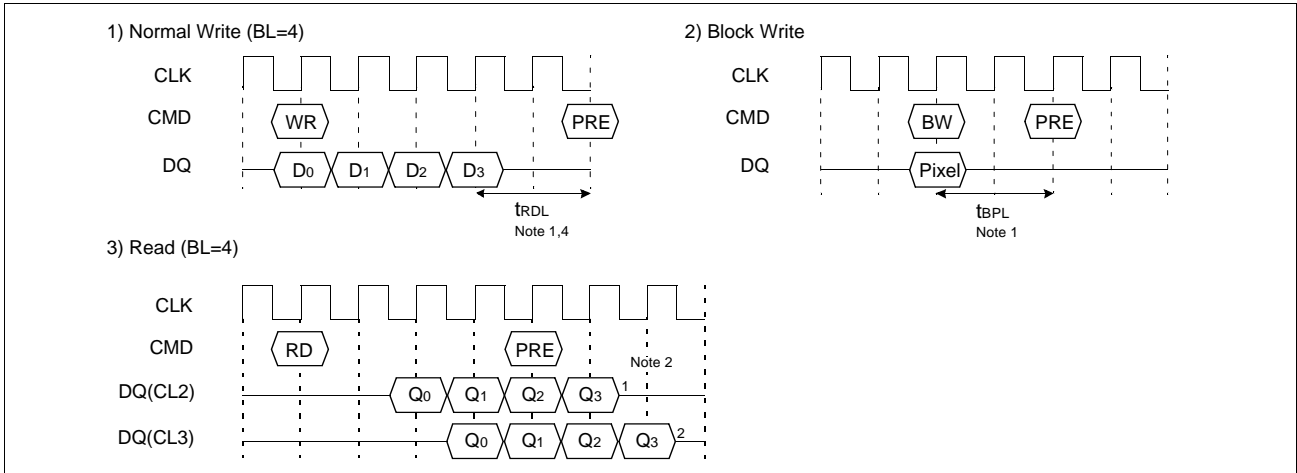

\*Note : 1. To prevent bus contention, there should be at least one gap between data in and data out.  
 2. To prevent bus contention, DQM should be issued which makes at least one gap between data in and data out.

5. Write Interrupted by Precharge & DQM

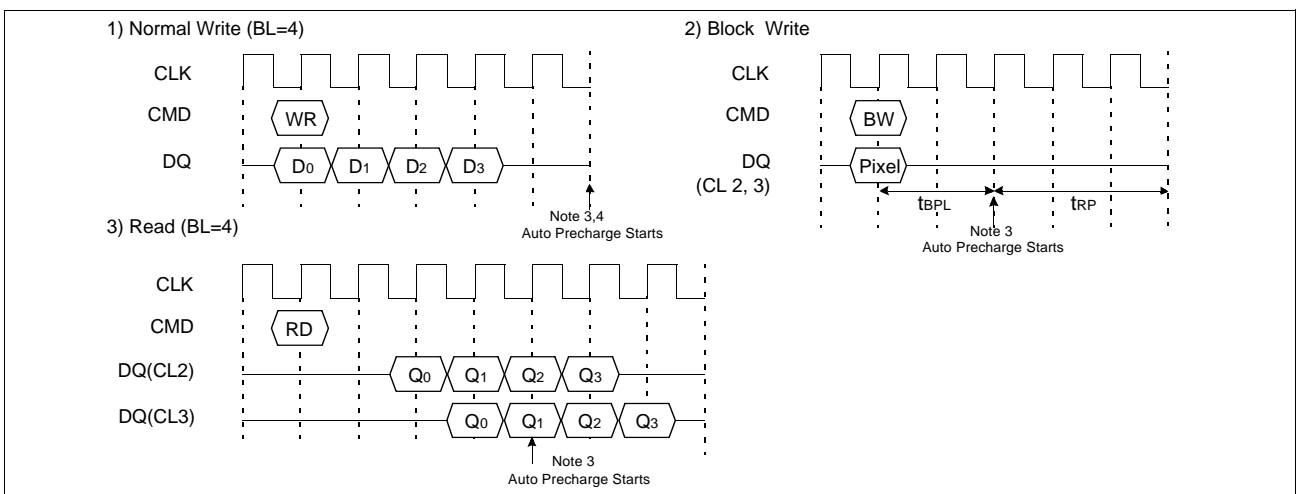

- \*Note : 1. To inhibit invalid write, DQM should be issued.
- 2. This precharge command and burst write command should be of the same bank, otherwise it is not precharge interrupt but only another bank precharge of dual banks operation.

6. Precharge

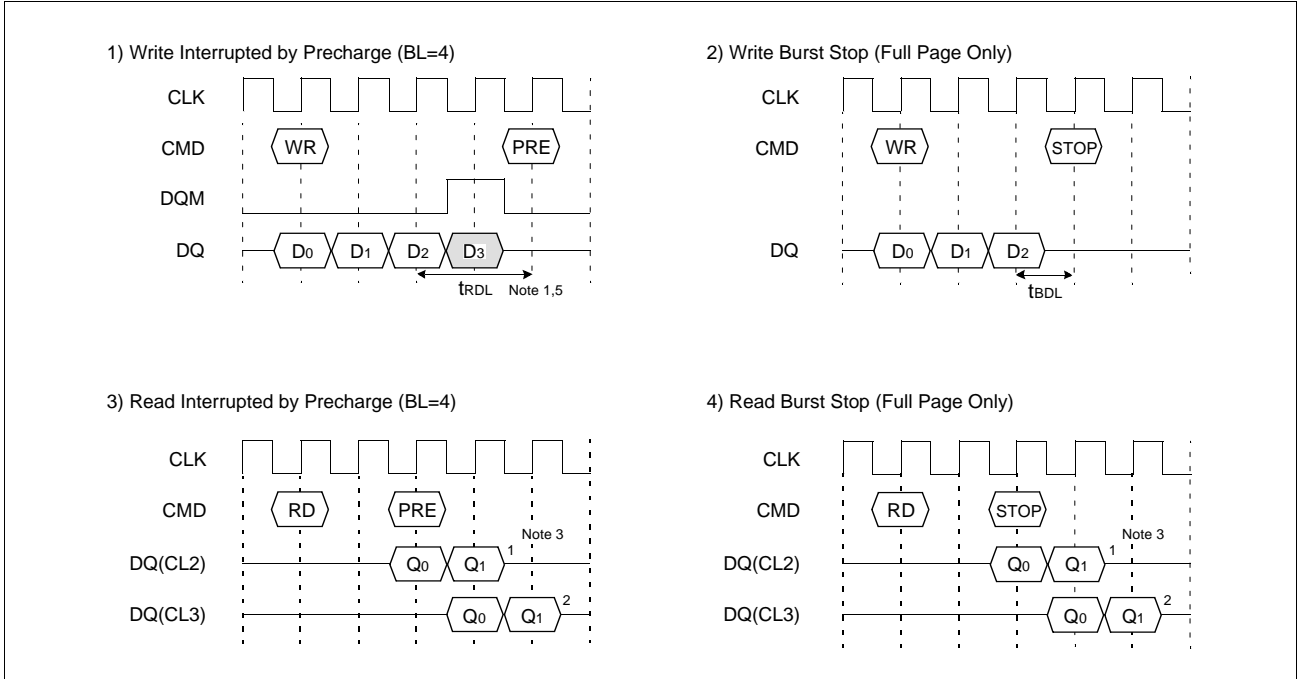

7. Auto Precharge

- \*Note :1. tBPL : Block write data-in to PRE command delay
- 2. Number of valid output data after Row Precharge : 1, 2 for CAS Latency =2, 3 respectively.
- 3. The row active command of the precharge bank can be issued after tRP from this point. The new read/write command of other activated bank can be issued from this point. At burst read/write with auto precharge, CAS interrupt of the same/another bank is illegal.
- 4. For -60/70 devices, tRDL can be programmed as 1CLK if Auto-Precharge is not used in the design

8. Burst Stop & Precharge Interrupt

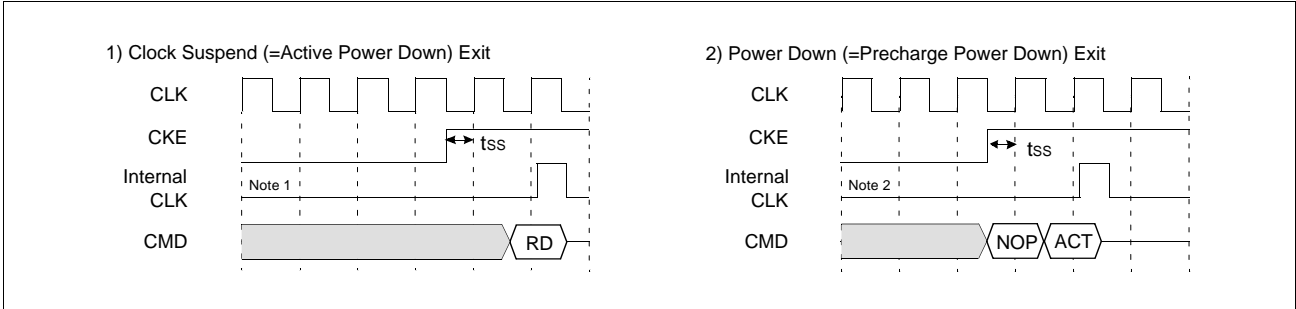

9. MRS & SMRS

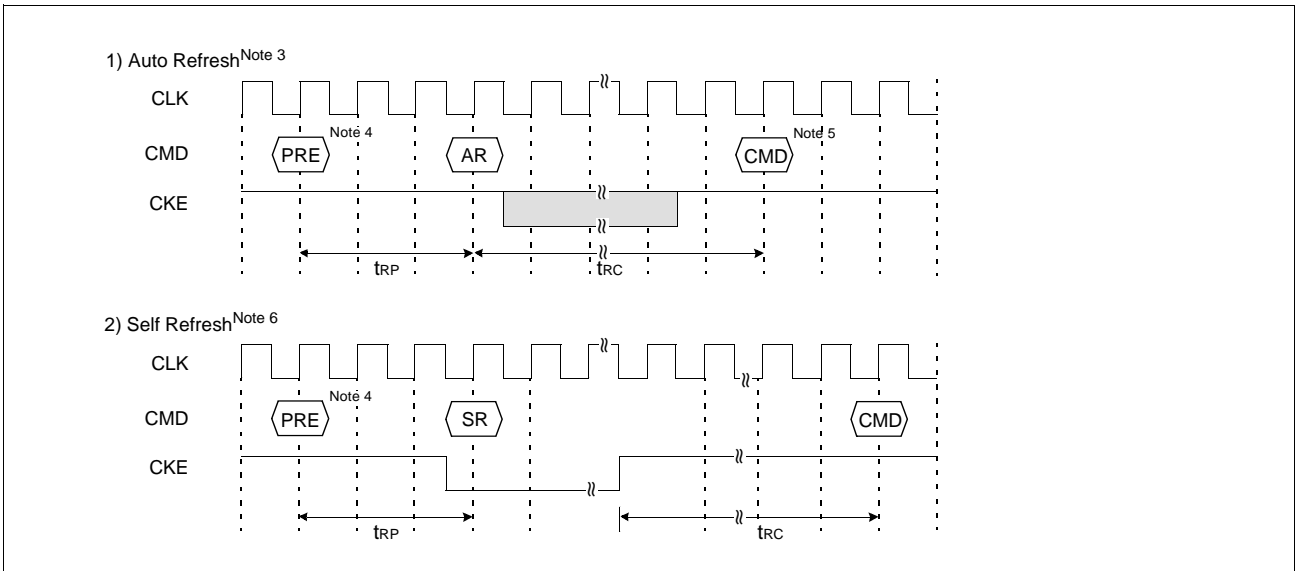

- \*Note : 1.  $t_{RD}$  : 2 CLK, Last Data in to Row Precharge.
- 2.  $t_{BDL}$  : 1 CLK, Last Data in to Burst Stop Delay.
- 3. Number of valid output data after Row precharge or burst stop : 1, 2 for CAS latency= 2, 3 respectively.
- 4. PRE : Both banks precharge if necessary.  
MRS can be issued only at all bank precharge state.
- 5. For -60/70 devices,  $t_{RD}$  can be programmed as 1CLK if Auto-Precharge is not used in the design

10. Clock Suspend Exit & Power Down Exit

11. Auto Refresh & Self Refresh

- \*Note : 1. Active power down : one or more bank active state.
- 2. Precharge power down : both bank precharge state.
- 3. The auto refresh is the same as CBR refresh of conventional DRAM.  
No precharge commands are required after Auto Refresh command.  
During tRC from auto refresh command, any other command can not be accepted.
- 4. Before executing auto/self refresh command, both banks must be idle state.
- 5. (S)MRS, Bank Active, Auto/Self Refresh, Power Down Mode Entry.
- 6. During self refresh mode, refresh interval and refresh operation are performed internally.  
After self refresh entry, self refresh mode is kept while CKE is LOW.  
During self refresh mode, all inputs except CKE will be don't cared, and outputs will be in Hi-Z state.  
During tRC from self refresh exit command, any other command can not be accepted.  
Before/After self refresh mode, burst auto refresh cycle (2K cycles) is recommended.

12. About Burst Type Control

Basic MODE	Sequential Counting	At MRS A <sub>3</sub> = "0". See the BURST SEQUENCE TABLE. (BL=4,8) BL=1, 2, 4, 8 and full page wrap around.
	Interleave Counting	At MRS A <sub>3</sub> = "1". See the BURST SEQUENCE TABLE. (BL=4,8) BL=4, 8. At BL=1, 2 Interleave Counting = Sequential Counting
Pseudo-MODE	<i>Pseudo-Decrement Sequential Counting</i>	At MRS A <sub>3</sub> = "1".(See to Interleave Counting Mode) Starting Address LSB 3 bits A <sub>0-2</sub> should be "000" or "111". @BL=8. -- if LSB="000" : Increment Counting. -- if LSB="111" : Decrement Counting. For Example,(Assume Addresses except LSB 3 bits are all 0, BL=8) -- @ write, LSB="000", Accessed Column in order 0-1-2-3-4-5-6-7 -- @ read, LSB="111", Accessed Column in order 7-6-5-4-3-2-1-0 At BL=4, same applications are possible. As above example, at Interleave Counting mode, by confining starting address to some values, <i>Pseudo-Decrement Counting Mode</i> can be realized. See the BURST SEQUENCE TABLE carefully.
	<i>Pseudo-Binary Counting</i>	At MRS A <sub>3</sub> = "0".(See to Sequential Counting Mode) A <sub>0-2</sub> = "111".(See to Full Page Mode) Using Full Page Mode and Burst Stop Command, Binary Counting Mode can be realized. -- @ Sequential Counting, Accessed Column in order 3-4-5-6-7-1-2-3(BL=8) -- @ <i>Pseudo-Binary Counting</i> , Accessed Column in order 3-4-5-6-7-8-9-10(Burst Stop command) Note. The next column address of 256 is 0.
Random MODE	Random column Access t <sub>CCD</sub> = 1 CLK	Every cycle Read/Write Command with random column address can realize Random Column Access. That is similar to Extended Data Out (EDO) Operation of conventional DRAM.

13. About Burst Length Control

Basic MODE	1	At MRS A <sub>2,1,0</sub> = "000". At auto precharge, t <sub>RAS</sub> should not be violated.
	2	At MRS A <sub>2,1,0</sub> = "001". At auto precharge, t <sub>RAS</sub> should not be violated.
	4	At MRS A <sub>2,1,0</sub> = "010".
	8	At MRS A <sub>2,1,0</sub> = "011".
	Full Page	At MRS A <sub>2,1,0</sub> = "111". <u>Wrap around mode</u> (Infinite burst length)should be stopped by burst stop, RAS interrupt or CAS interrupt.
Special MODE	BRSW	At MRS A <sub>9</sub> = "1". Read burst =1, 2, 4, 8, full page/write Burst =1 At auto precharge of write, t <sub>RAS</sub> should not be violated.
	Block Write	8 Column Block Write. LSB A <sub>0-2</sub> are ignored. Burst length=1. t <sub>BWC</sub> should not be violated. At auto precharge, t <sub>RAS</sub> should not be violated.
Random MODE	Burst Stop	t <sub>BDL</sub> = 1, Valid DQ after burst stop is 1, 2 for CL=2, 3 respectively Using burst stop command, it is possible only at full page burst length.
Interrupt MODE	$\overline{\text{RAS}}$ Interrupt (Interrupted by Precharge)	Before the end of burst, Row precharge command of the same bank stops read/write burst with Row precharge. t <sub>RDL</sub> = 2 with DQM, valid DQ after burst stop is 1, 2 for CL= 2, 3 respectively During read/write burst with auto precharge, $\overline{\text{RAS}}$ interrupt cannot be issued.
	$\overline{\text{CAS}}$ Interrupt	Before the end of burst, new read/write stops read/write burst and starts new read/write burst or block write. During read/write burst with auto precharge, $\overline{\text{CAS}}$ interrupt can not be issued.

14. Mask Functions

Block Write

Pixel masking : By Pixel Data issued through DQ pin, the selected pixels keep the original data.  
See PIXEL TO DQ MAPPING TABLE.

*If Pixel 0, 4, 9, 13, 18, 22, 27 and 31 keep the original white color.*

Assume 8bpp,

White = "0000,0000", Red="1010,0011", Green = "1110,0001", Yellow = "0000,1111", Blue = "1100,0011"

i) STEP

- SMRS(LCR) :Load color(for 8bpp, through x32 DQ color0-3 are loaded into color registers)  
Load(color3, color2, color1, color0) = (Blue, Green, Yellow, Red)  
= "1100,0011, 1110, 0001, 0000, 1111, 1010, 0011"

- Row Active with DSF "L"

- Block write with DQ[31-0] = "0111, 0111, 1011, 1011, 1101, 1101, 1110, 1110"

i) ILLUSTRATION

I/O(=DQ)	31	24	23	16	15	8	7	0
DQM <sub>i</sub>	DQM <sub>3</sub> =0		DQM <sub>2</sub> =0		DQM <sub>1</sub> =0		DQM <sub>0</sub> =1

Before Block Write & DQ (Pixel data)	000	White DQ <sub>24</sub> =H	White DQ <sub>16</sub> =H	White DQ <sub>8</sub> =H	White DQ <sub>8</sub> =H	White DQ <sub>0</sub> =L	White DQ <sub>0</sub> =L	White DQ <sub>0</sub> =L
	001	White DQ <sub>25</sub> =H	White DQ <sub>17</sub> =H	White DQ <sub>9</sub> =L	White DQ <sub>9</sub> =L	White DQ <sub>1</sub> =H	White DQ <sub>1</sub> =H	White DQ <sub>1</sub> =H
	010	White DQ <sub>26</sub> =H	White DQ <sub>18</sub> =L	White DQ <sub>10</sub> =H	White DQ <sub>10</sub> =H	White DQ <sub>2</sub> =H	White DQ <sub>2</sub> =H	White DQ <sub>2</sub> =H
	011	White DQ <sub>27</sub> =L	White DQ <sub>19</sub> =H	White DQ <sub>11</sub> =H	White DQ <sub>11</sub> =H	White DQ <sub>3</sub> =H	White DQ <sub>3</sub> =H	White DQ <sub>3</sub> =H
	100	White DQ <sub>28</sub> =H	White DQ <sub>20</sub> =H	White DQ <sub>12</sub> =H	White DQ <sub>12</sub> =H	White DQ <sub>4</sub> =L	White DQ <sub>4</sub> =L	White DQ <sub>4</sub> =L
	101	White DQ <sub>29</sub> =H	White DQ <sub>21</sub> =H	White DQ <sub>13</sub> =L	White DQ <sub>13</sub> =L	White DQ <sub>5</sub> =H	White DQ <sub>5</sub> =H	White DQ <sub>5</sub> =H
	110	White DQ <sub>30</sub> =H	White DQ <sub>22</sub> =L	White DQ <sub>14</sub> =H	White DQ <sub>14</sub> =H	White DQ <sub>6</sub> =H	White DQ <sub>6</sub> =H	White DQ <sub>6</sub> =H
	111	White DQ <sub>31</sub> =L	White DQ <sub>23</sub> =H	White DQ <sub>15</sub> =H	White DQ <sub>15</sub> =H	White DQ <sub>7</sub> =H	White DQ <sub>7</sub> =H	White DQ <sub>7</sub> =H
After Block Write	000	Blue	Green	Yellow	Yellow	White	White	White
	001	Blue	Green	White	White	White	White	White
	010	Blue	White	Yellow	Yellow	White	White	White
	011	White	Green	Yellow	Yellow	White	White	White
	100	Blue	Green	Yellow	Yellow	White	White	White
	101	Blue	Green	White	White	White	White	White
	110	Blue	White	Yellow	Yellow	White	White	White
	111	White	Green	Yellow	Yellow	White	White	White

Note 2

\*Note : 1. DQM byte masking.

2. At normal write, ONE column is selected among columns decoded by A<sub>2-0</sub>(000-111).

At block write, instead of ignored address A<sub>2-0</sub>, DQ<sub>0-31</sub> control each pixel.

Power On Sequence & Auto Refresh

Single Bit Read-Write-Read Cycle(Same Page) @CAS Latency=3, Burst Length=1

- \*Note : 1. All input can be don't care when  $\overline{CS}$  is high at the CLK high going edge.  
 2. Bank active & read/write are controlled by BA.

BA	Active & Read/Write
0	Bank A
1	Bank B

3. Enable and disable auto precharge function are controlled by A8/AP in read/write command.

A8/AP	BA	Operation
0	0	Disable auto precharge, leave bank A active at end of burst.
	1	Disable auto precharge, leave bank B active at end of burst.
1	0	Enable auto precharge, precharge bank A at end of burst.
	1	Enable auto precharge, precharge bank B at end of burst.

4. A8/AP and BA control bank precharge when precharge command is asserted.

A8/AP	BA	Precharge
0	0	Bank A
0	1	Bank B
1	X	Both Bank

5. Block write/normal write is controlled by DSF.

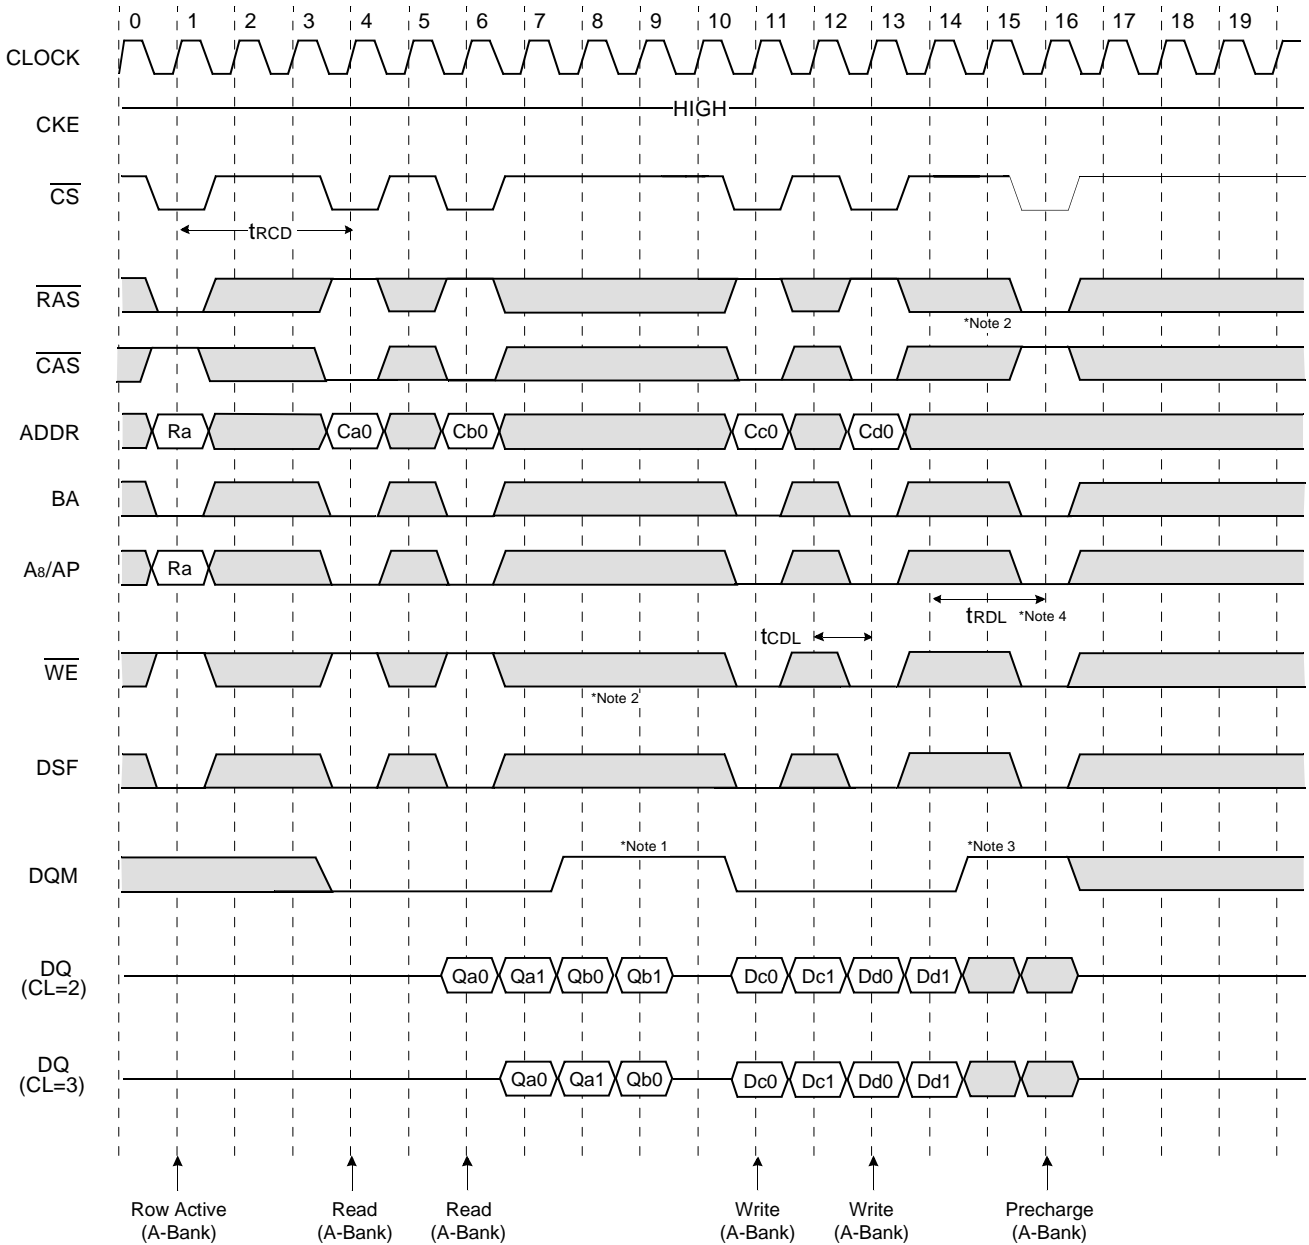

DSF	Operation	Minimum cycle time
L	Normal write	$t_{CCD}$
H	Block write	$t_{BWC}$

Read & Write Cycle at Same Bank @Burst Length=4

- \*Note :**
1. Minimum row cycle times is required to complete internal DRAM operation.
  2. Row precharge can interrupt burst on any cycle. [CAS Latency - 1] valid output data available after Row enters precharge. Last valid output will be Hi-Z after tSHZ from the clock.
  3. Access time from Row address.  $t_{CC} = (t_{RCD} + \text{CAS latency} - 1) + t_{SAC}$
  4. Output will be Hi-Z after the end of burst. (1, 2, 4, & 8). At Full page bit burst, burst is wrap-around.
  5. For -60/70 devices, tRDL can be programmed as 1CLK if Auto-Precharge is not used in the design

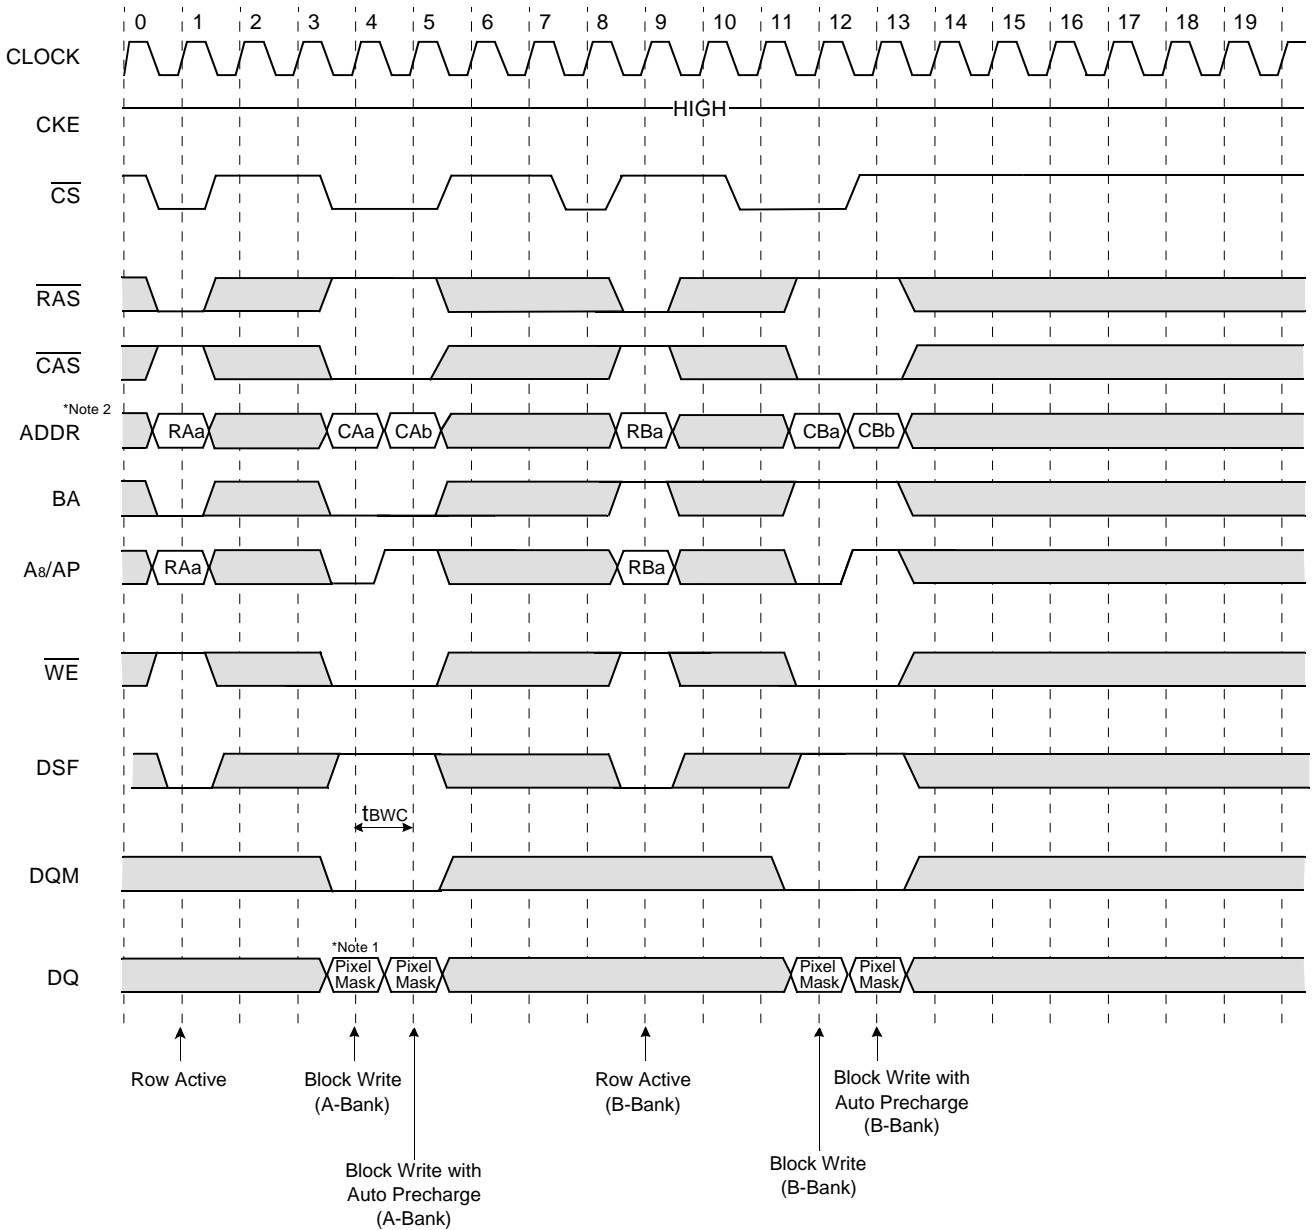

Page Read & Write Cycle at Same Bank @Burst Length=4

□ : Don't care

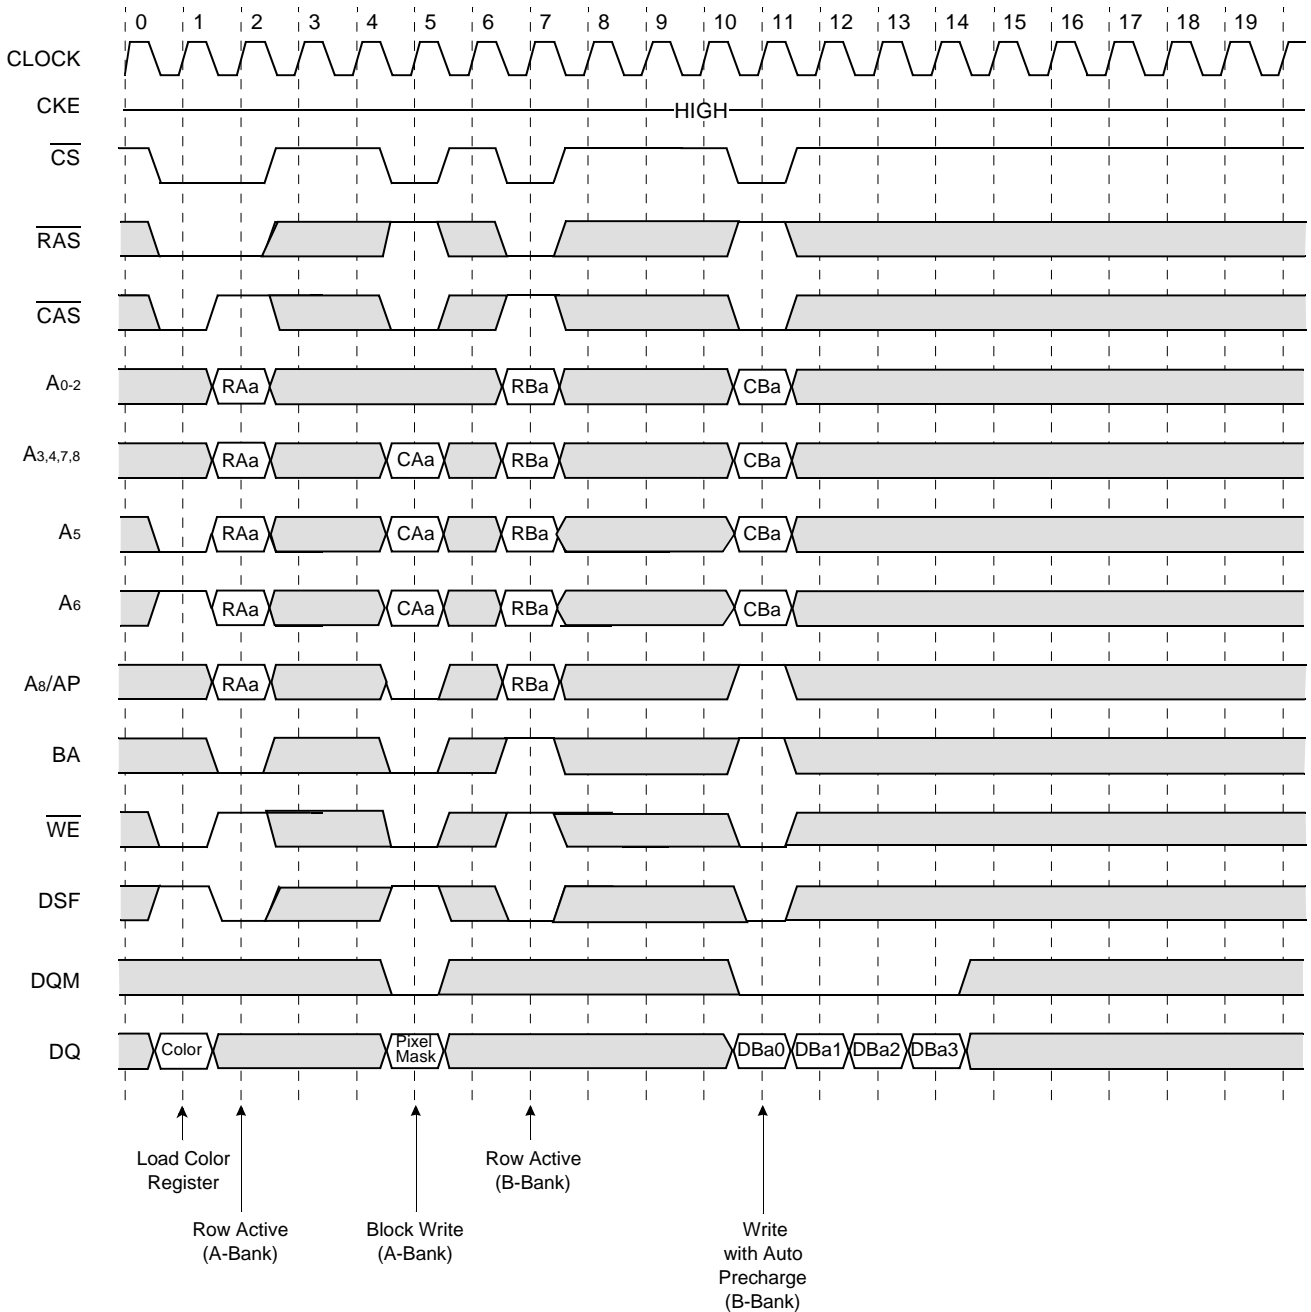

- \*Note :**
- To write data before burst read ends, DQM should be asserted three cycle prior to write command to avoid bus contention.
  - Row precharge will interrupt writing. Last data input,  $t_{RDL}$  before Row precharge, will be written.
  - DQM should mask invalid input data on precharge command cycle when asserting precharge before end of burst. Input data after Row precharge cycle will be masked internally.
  - For -60/70 devices,  $t_{RDL}$  can be programmed as 1CLK if Auto-Precharge is not used in the design

Block Write cycle(with Auto Precharge)

\*Note : 1. Column Mask(DQi=L : Mask, DQi=H :Non Mask)  
 2. At Block Write, CA0-2 are ignored.

SMRS and Block/Normal Write @ Burst Length=4

Page Read Cycle at Different Bank @Burst Length=4

□ : Don't care

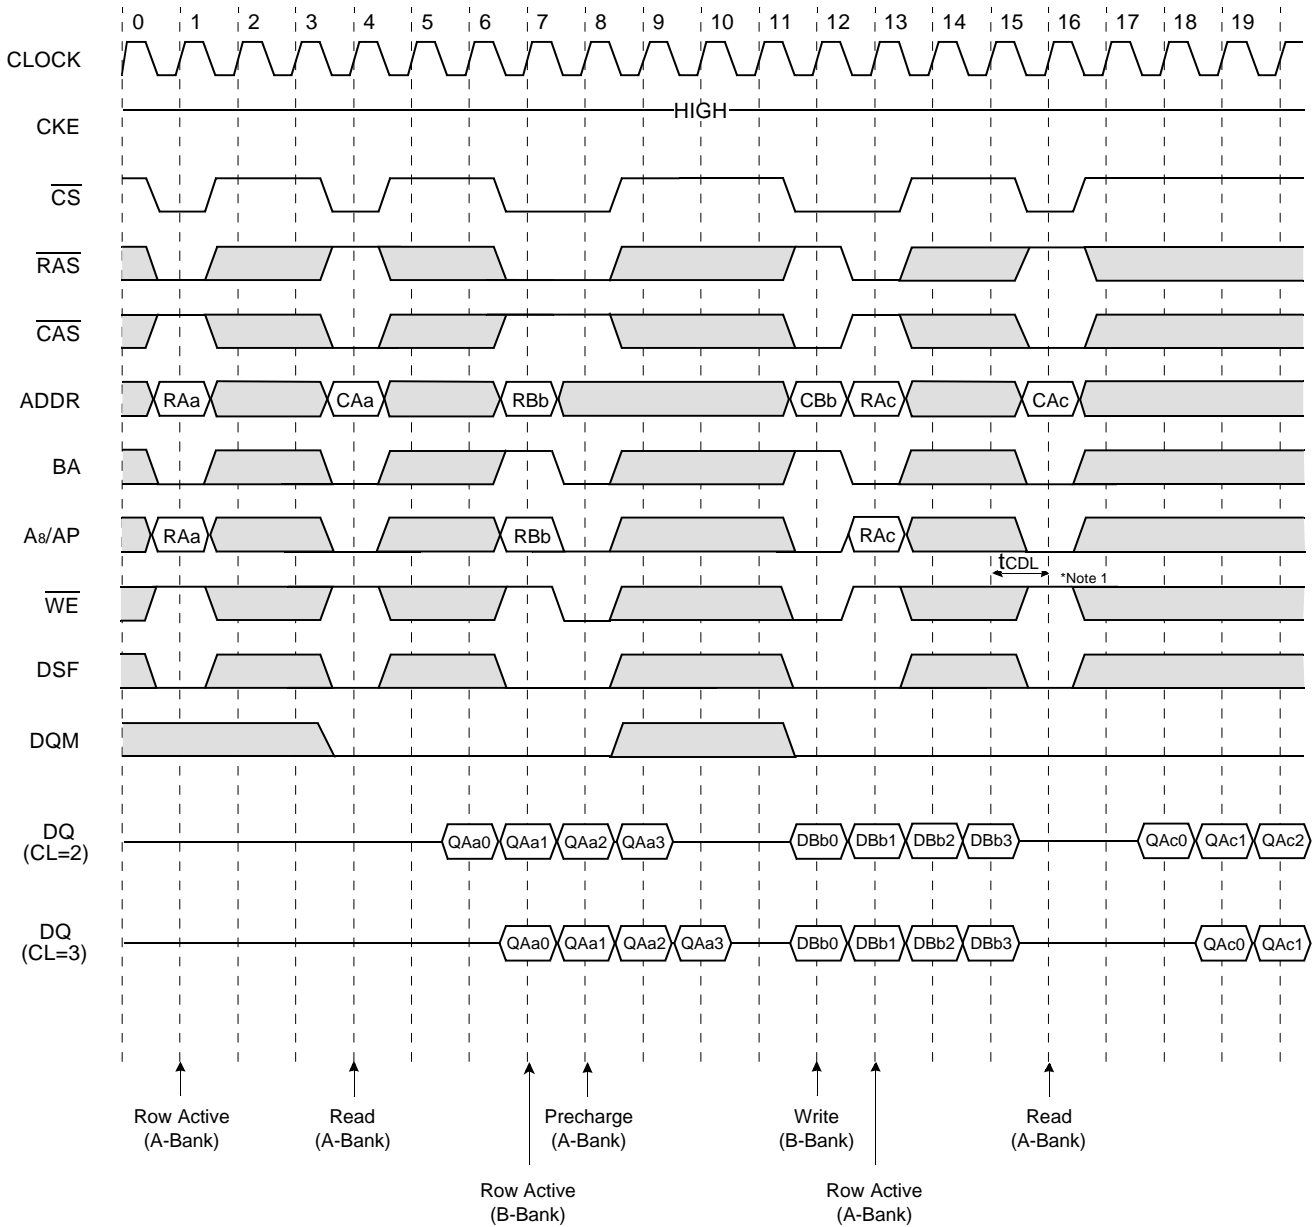

\*Note : 1.  $\overline{CS}$  can be don't care when  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  are high at the clock high going edge.  
 2. To interrupt a burst read by row precharge, both the read and the precharge banks must be the same.

Page Write Cycle at Different Bank @Burst Length=4

□ : Don't care

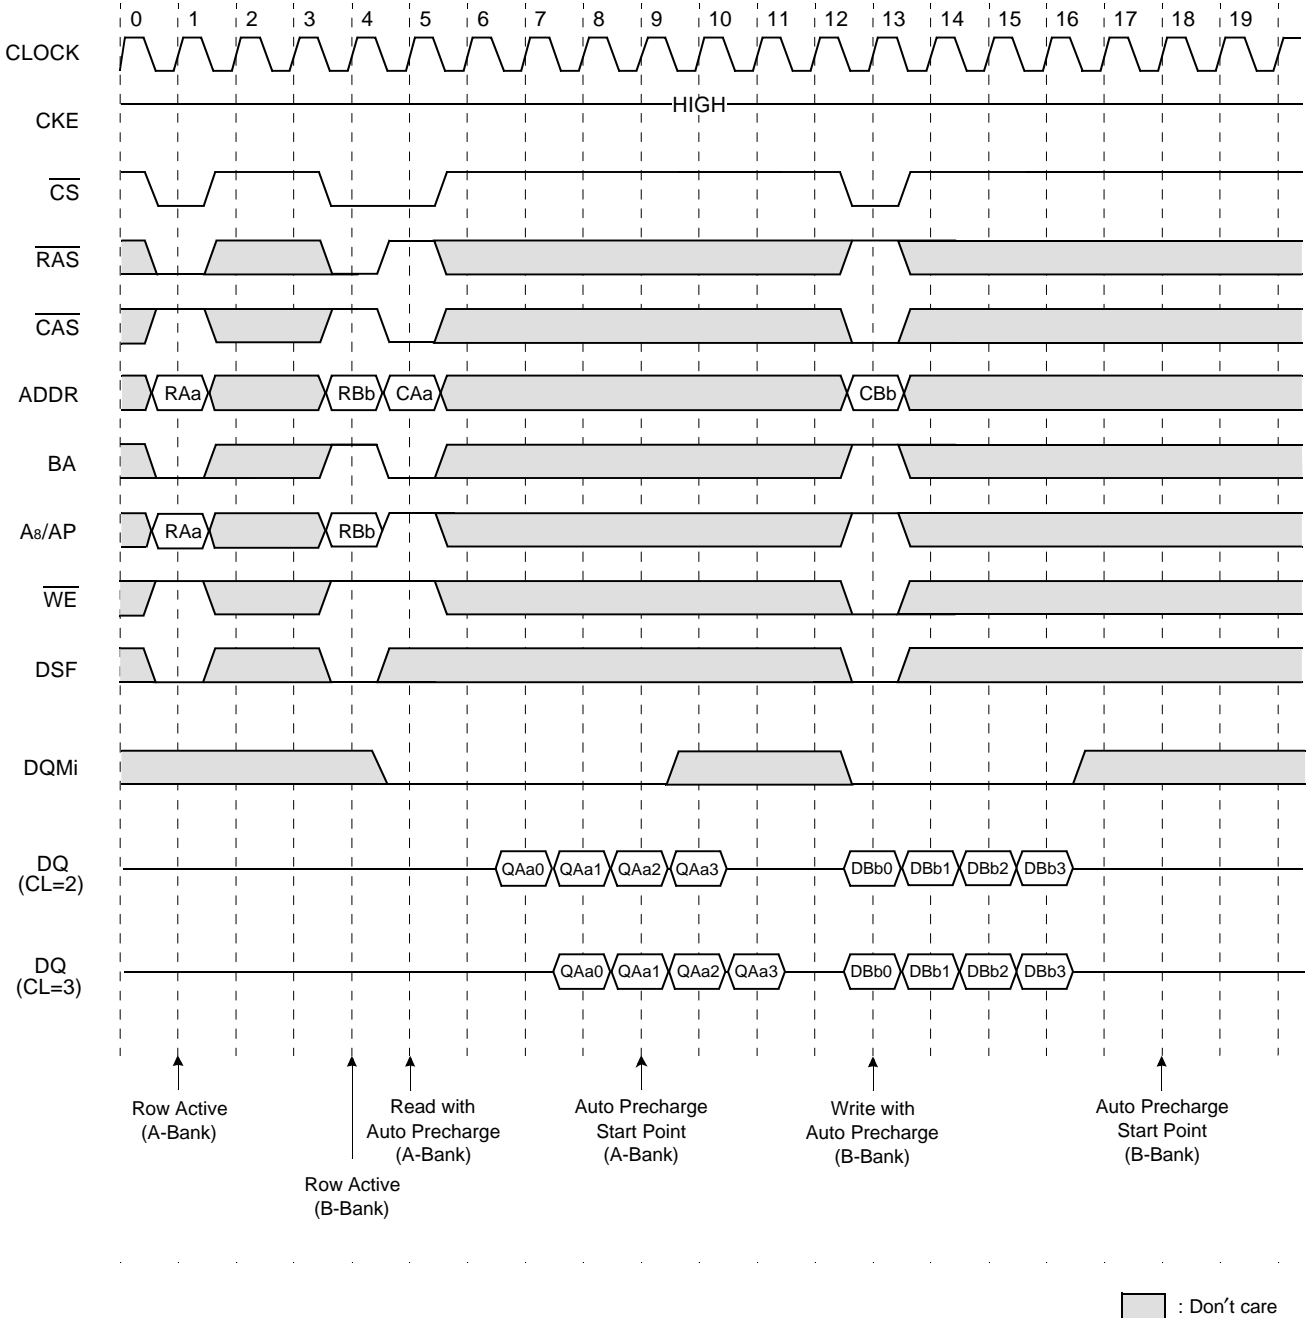

Read & Write Cycle at Different Bank @Burst Length=4

□ : Don't care

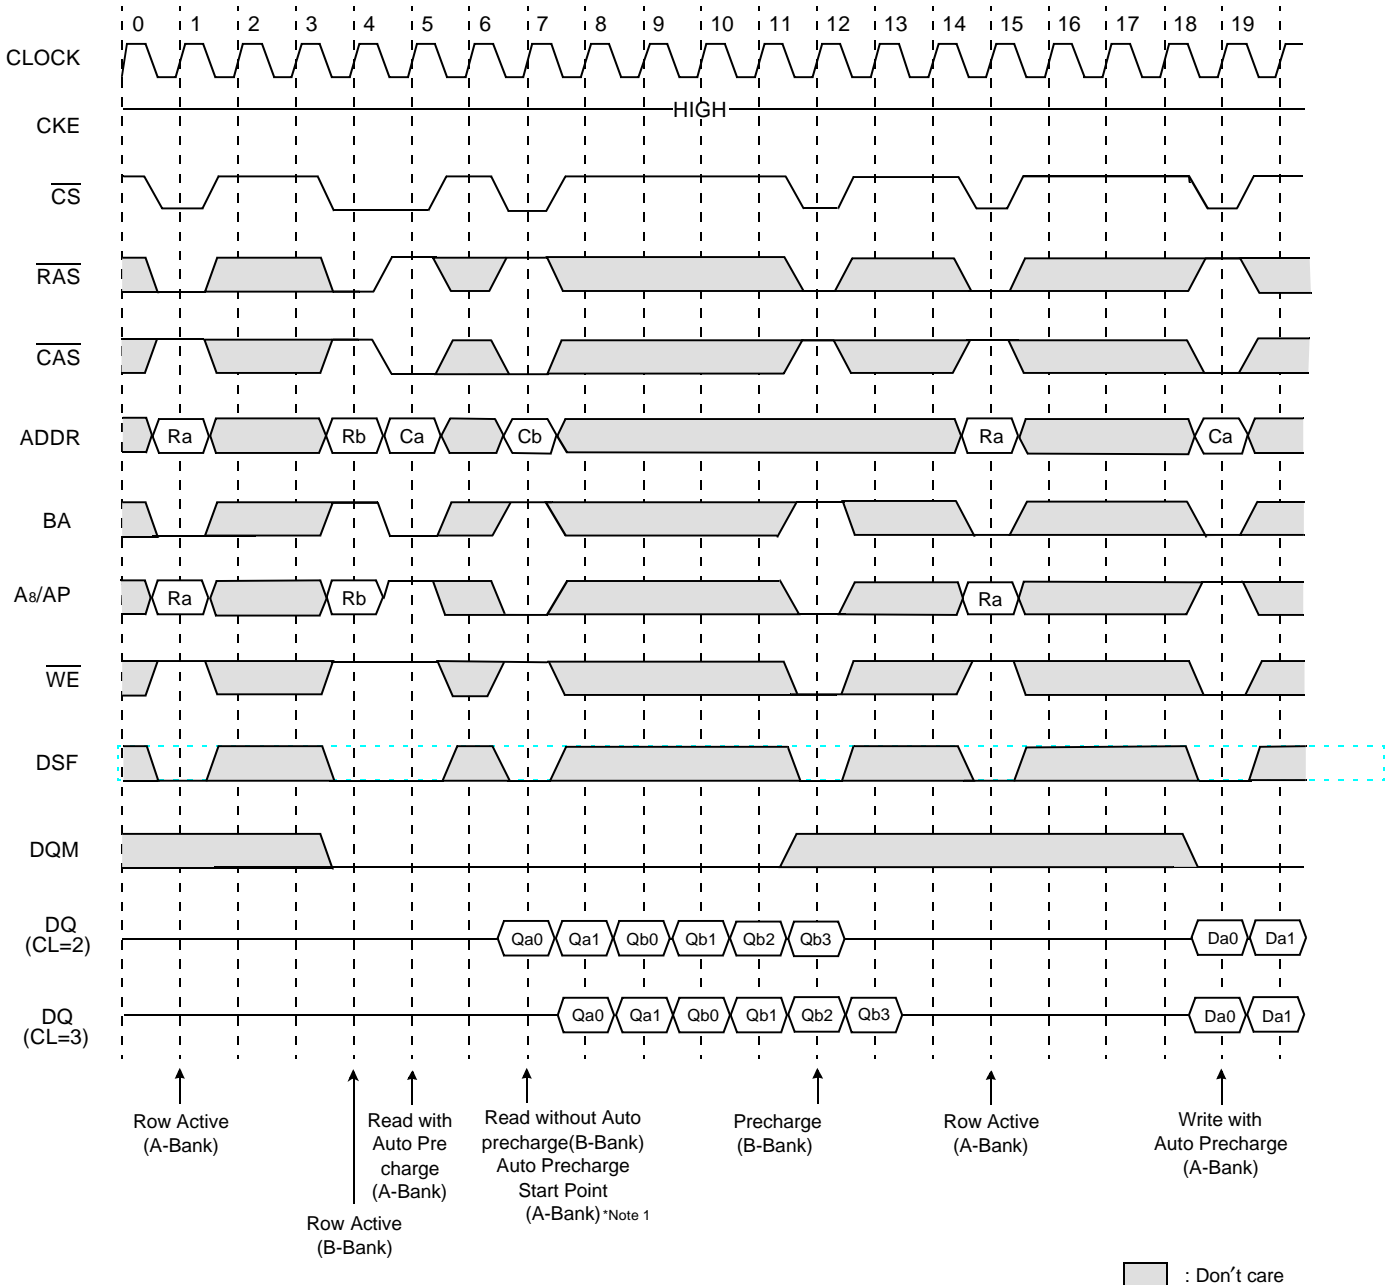

\*Note : 1. t<sub>CDL</sub> should be met to complete write.

Read & Write Cycle with Auto Precharge I @Burst Length=4

\*Note : 1. tRCD should be controlled to meet minimum tRAS before internal precharge start.  
(In the case of Burst Length=1 & 2, BRSW mode and Block write)

Read & Write Cycle with Auto Precharge II @Burst Length=4

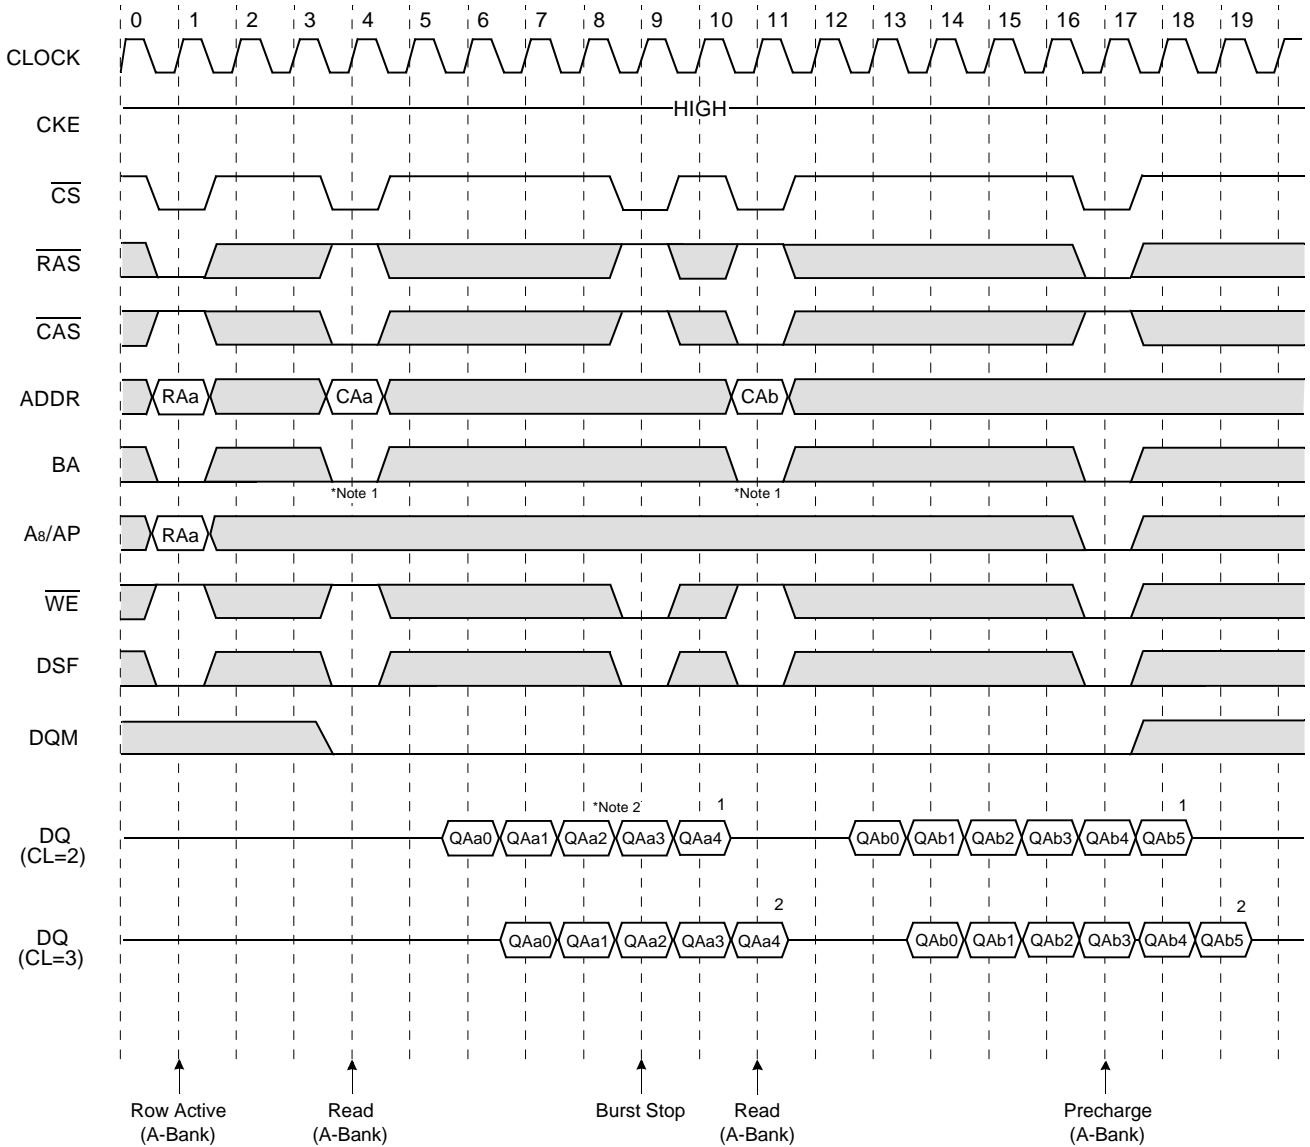

**\*Note:** 1. When Read(Write) command with auto precharge is issued at A-Bank after A and B Bank activation.  
 - if Read(Write) command without auto precharge is issued at B-Bank before A Bank auto precharge starts, A Bank auto precharge will start at B Bank read command input point .  
 - any command can not be issued at A Bank during tRP after A Bank auto precharge starts.

Read & Write Cycle with Auto Precharge III @Burst Length=4

\*Note: 1. Any command to A-bank is not allowed in this period.  
tRP is determined from at auto precharge start point

Read Interrupted by Precharge Command & Read Burst Stop Cycle (@Full page Only)

□ : Don't care

**\*Note :** 1. At full page mode, burst is wrap-around at the end of burst. So auto precharge is impossible.  
 2. About the valid DQ's after burst stop, it is same as the case of RAS interrupt. Both cases are illustrated above timing diagram. See the label 1, 2 on them. But at burst write, Burst stop and RAS interrupt should be compared carefully. Refer the timing diagram of "Full page write burst stop cycle".

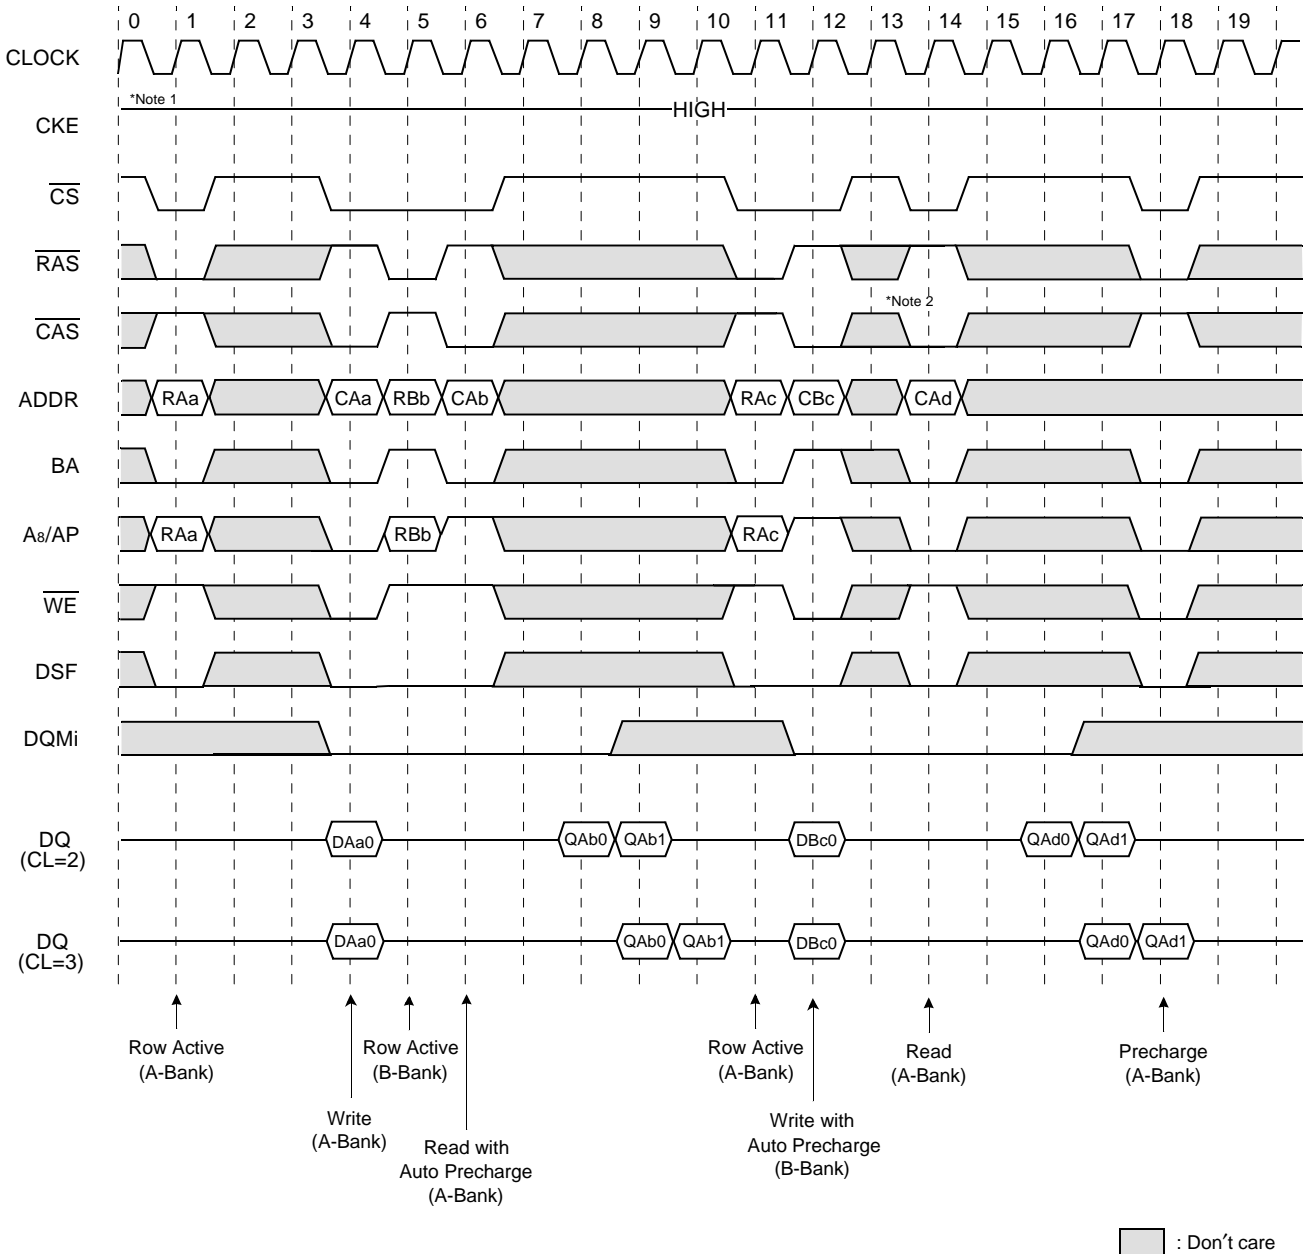

Write Interrupted by Precharge Command & Write Burst Stop Cycle (@ Full page Only)

- \*Note :**
- At full page mode, burst is wrap-around at the end of burst. So auto precharge is impossible.
  - Data-in at the cycle of burst stop command cannot be written into the corresponding memory cell.  
It is defined by AC parameter of tBDL(=1CLK).
  - Data-in at the cycle of interrupted by precharge cannot be written into the corresponding memory cell.  
It is defined by AC parameter of tRDL(=2CLK).  
DQM at write interrupted by precharge command is needed to ensure tRDL of 2CLK.  
DQM should mask invalid input data on precharge command cycle when asserting precharge before end of burst.  
Input data after Row precharge cycle will be masked internally.
  - Burst stop is valid only at full page burst length.
  - For -60/70 devices, tRDL can be programmed as 1CLK if Auto-Precharge is not used in the design**

Burst Read Single bit Write Cycle @Burst Length=2, BRSW

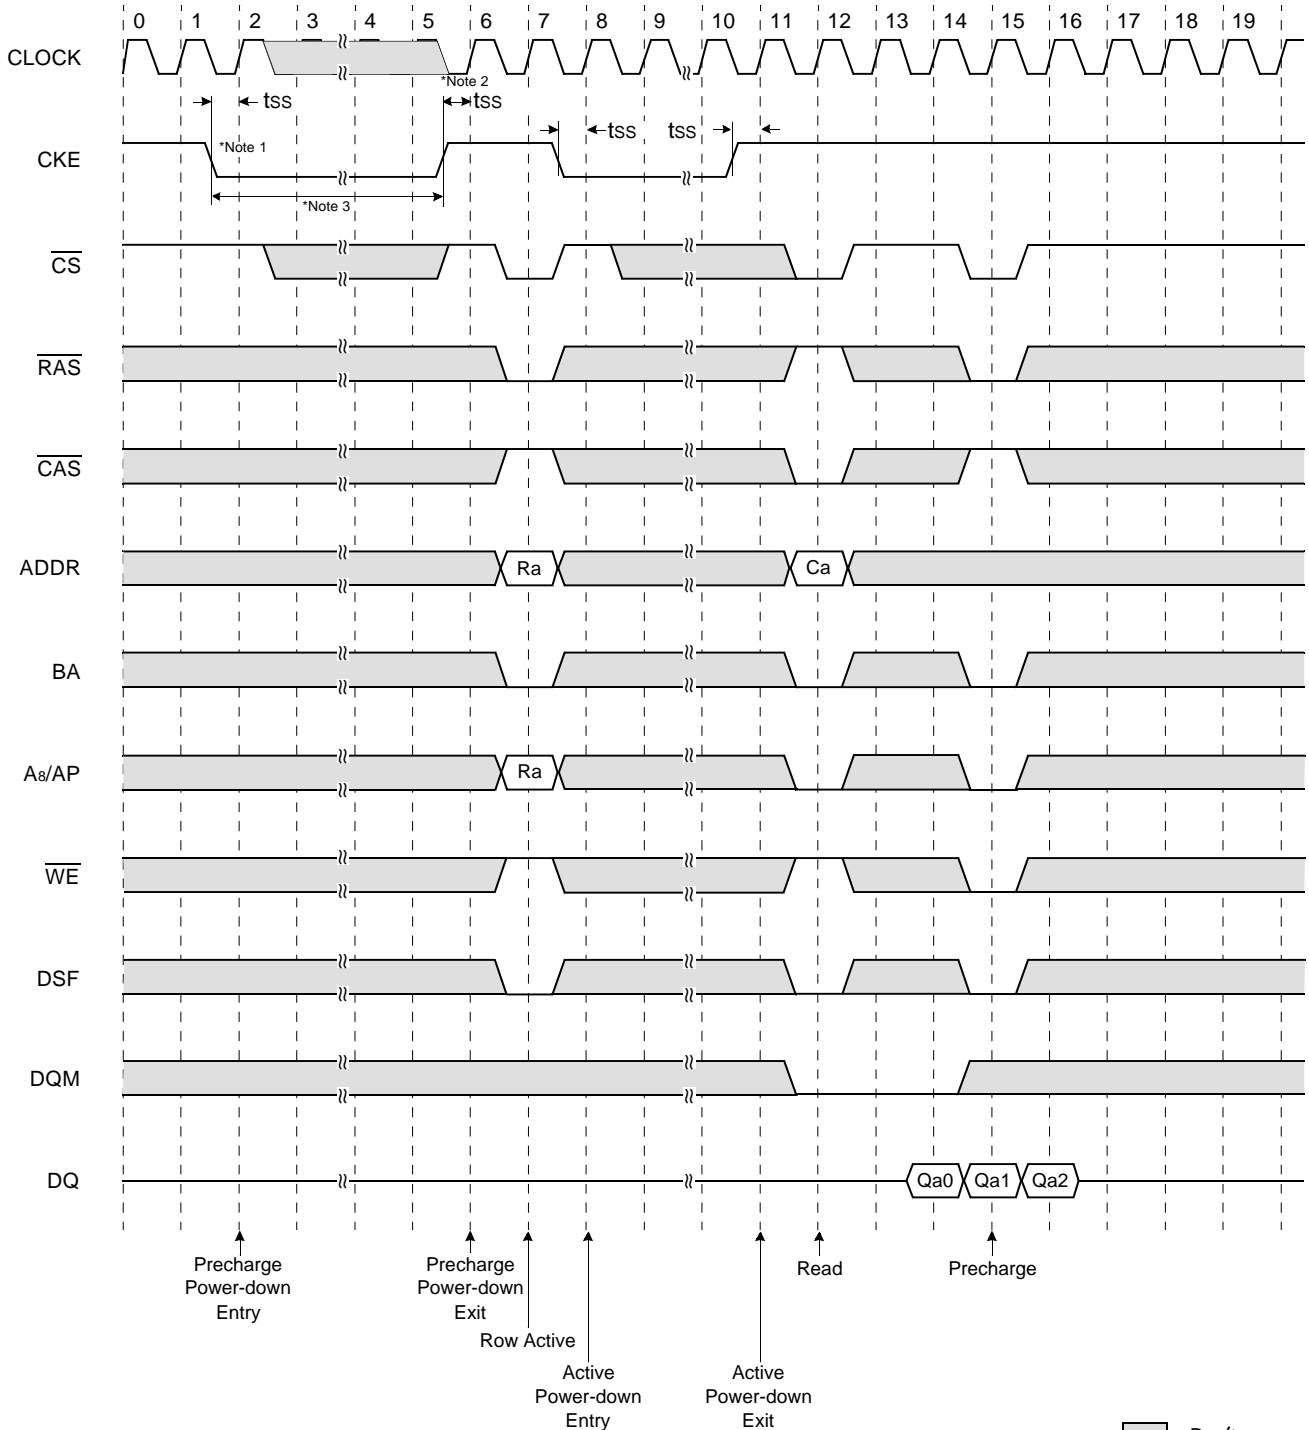

**\*Note :** 1. BRSW mode is enabled by setting A<sub>9</sub> "High" at MRS (Mode Register Set).  
 At the BRSW Mode, the burst length at write is fixed to "1" regardless of programmed burst length.  
 2. When BRSW write command with auto precharge is executed, keep it in mind that t<sub>RAS</sub> should not be violated.  
 Auto precharge is executed at the burst-end cycle, so in the case of BRSW write command, the next cycle starts the precharge.

Clock suspension & DQM operation cycle @CAS Latency=2, Burst Length=4

\*Note : 1. DQM needed to prevent bus contention.

Active/Precharge Power Down Mode @ CAS Latency=2, Burst Length=4

- \*Note :**
1. All banks should be in idle state prior to entering precharge power down mode.
  2. CKE should be set high at least "1CLK + tss" prior to Row active command.
  3. Cannot violate minimum refresh specification. (32ms)

□ : Don't care

Self Refresh Entry & Exit Cycle

**\*Note : TO ENTER SELF REFRESH MODE**

1. CS, RAS & CAS with CKE should be low at the same clock cycle.
2. After 1 clock cycle, all the inputs including the system clock can be don't care except for CKE.
3. The device remains in self refresh mode as long as CKE stays "Low".  
cf.) Once the device enters self refresh mode, minimum t<sub>AS</sub> is required before exit from self refresh.

□ : Don't care

**TO EXIT SELF REFRESH MODE**

4. System clock restart and be stable before returning CKE high.
5. CS starts from high.
6. Minimum t<sub>RC</sub> is required after CKE going high to complete self refresh exit.
7. 2K cycle of burst auto refresh is required before self refresh entry and after self refresh exit if the system uses burst refresh.

Mode Register Set Cycle

Auto Refresh Cycle

\* Both banks precharge should be completed before Mode Register Set cycle and auto refresh cycle.

MODE REGISTER SET CYCLE

- \*Note : 1.  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , &  $\overline{WE}$  activation and DSF of low at the same clock cycle with address key will set internal mode register.
- 2. Minimum 1 clock cycles should be met before new  $\overline{RAS}$  activation.
- 3. Please refer to Mode Register Set table.

FUNCTION TRUTH TABLE (TABLE 1, Continued)

ABBREVIATIONS

RA = Row Address(A0~A10)      BA = Bank Address      PA = Precharge All(A8)  
 NOP = No Operation Command      CA = Column Address(A0~A7)      AP = Auto Precharge(A8)

- \*Note :**
1. All entries assume that CKE was active(High) during the preceding clock cycle and the current clock cycle.
  2. Illegal to bank in specified state ; Function may be legal in the bank indicated by BA, depending on the state of that bank.
  3. Must satisfy bus contention, bus turn around, and/or write recovery requirements.
  4. NOP to bank precharging or in idle state. May precharge bank indicated by BA(and PA).
  5. Illegal if any banks is not idle.
  6. Legal only if all banks are in idle or row active state.
