0. Ordering Information

Organization	DDR2-533 4-4-4	DDR2-400 3-3-3	Package
256Mx4	K4T1G044QM-ZCD5	K4T1G044QM-ZCCC	Lead-Free
128Mx8	K4T1G084QM-ZCD5	K4T1G084QM-ZCCC	Lead-Free
64Mx16	K4T1G164QM-ZCD5	K4T1G164QM-ZCCC	Lead-Free

Note : Speed bin is in order of CL-tRCD-tRP

1.Key Features

Speed	DDR2-533 4-4-4	DDR2-400 3-3-3	Units
CAS Latency	4	3	tCK
tRCD(min)	15	15	ns
tRP(min)	15	15	ns
tRC(min)	55	55	ns

- JEDEC standard 1.8V ± 0.1V Power Supply
- VDDQ = 1.8V ± 0.1V
- 200 MHz f_{CK} for 400Mb/sec/pin, 267MHz f_{CK} for 533Mb/sec/pin.
- 8 Banks
- Posted $\overline{CAS}$
- Programmable $\overline{CAS}$ Latency: 3, 4, 5
- Programmable Additive Latency: 0, 1 , 2 , 3 and 4
- Write Latency(WL) = Read Latency(RL) -1
- Burst Length: 4 , 8(Interleave/nibble sequential)
- Programmable Sequential / Interleave Burst Mode
- Bi-directional Differential Data-Strobe (Single-ended data-strobe is an optional feature)
- Off-Chip Driver(OCD) Impedance Adjustment
- On Die Termination
- Average Refresh Period 7.8us at lower than T_{CASE} 85°C, 3.9us at 85°C < T_{CASE} ≤ 95 °C
- Package: 68ball FBGA - 256Mx4/128Mx8 , 92ball FBGA - 64Mx16
- All of Lead-free products are compliant for RoHS

The 1Gb DDR2 SDRAM is organized as a 32Mbit x 4 I/Os x 8 banks, 16Mbit x 8 I/Os x 8banks or 8Mbit x 16 I/Os x 8 banks device. This synchronous device achieves high speed double-data-rate transfer rates of up to 533Mb/sec/pin (DDR2-533) for general applications.

The chip is designed to comply with the following key DDR2 SDRAM features such as posted CAS with additive latency, write latency = read latency - 1, Off-Chip Driver(OCD) impedance adjustment and On Die Termination.

All of the control and address inputs are synchronized with a pair of externally supplied differential clocks. Inputs are latched at the crosspoint of differential clocks (CK rising and $\overline{CK}$ falling). All I/Os are synchronized with a pair of bidirectional strobes (DQS and $\overline{DQS}$) in a source synchronous fashion. The address bus is used to convey row, column, and bank address information in a $\overline{RAS}/\overline{CAS}$ multiplexing style. For example, 1Gb(x4) device receive 14/11/3 addressing.

The 1Gb DDR2 device operates with a single 1.8V ± 0.1V power supply and 1.8V ± 0.1V VDDQ.

The 1Gb DDR2 device is available in 68ball FBGAs(x4/x8) and in 92ball FBGAs(x16).

Note: The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.

Note : This data sheet is an abstract of full DDR2 specification and does not cover the common features which are described in “DDR2 SDRAM Device Operation & Timing Diagram”.

2. Package Pinout/Mechnical Dimension & Addressing

2.1 Package Pinout

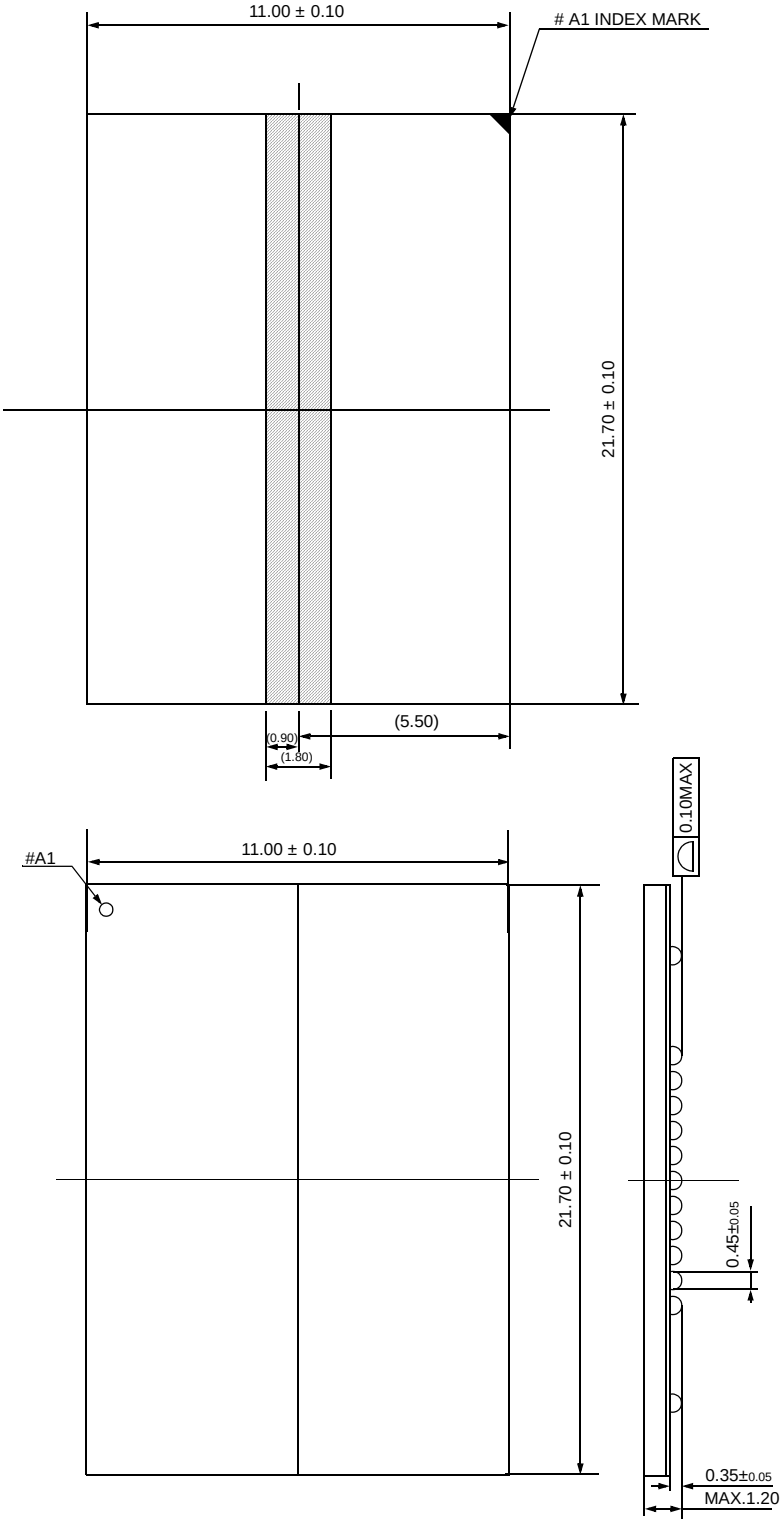
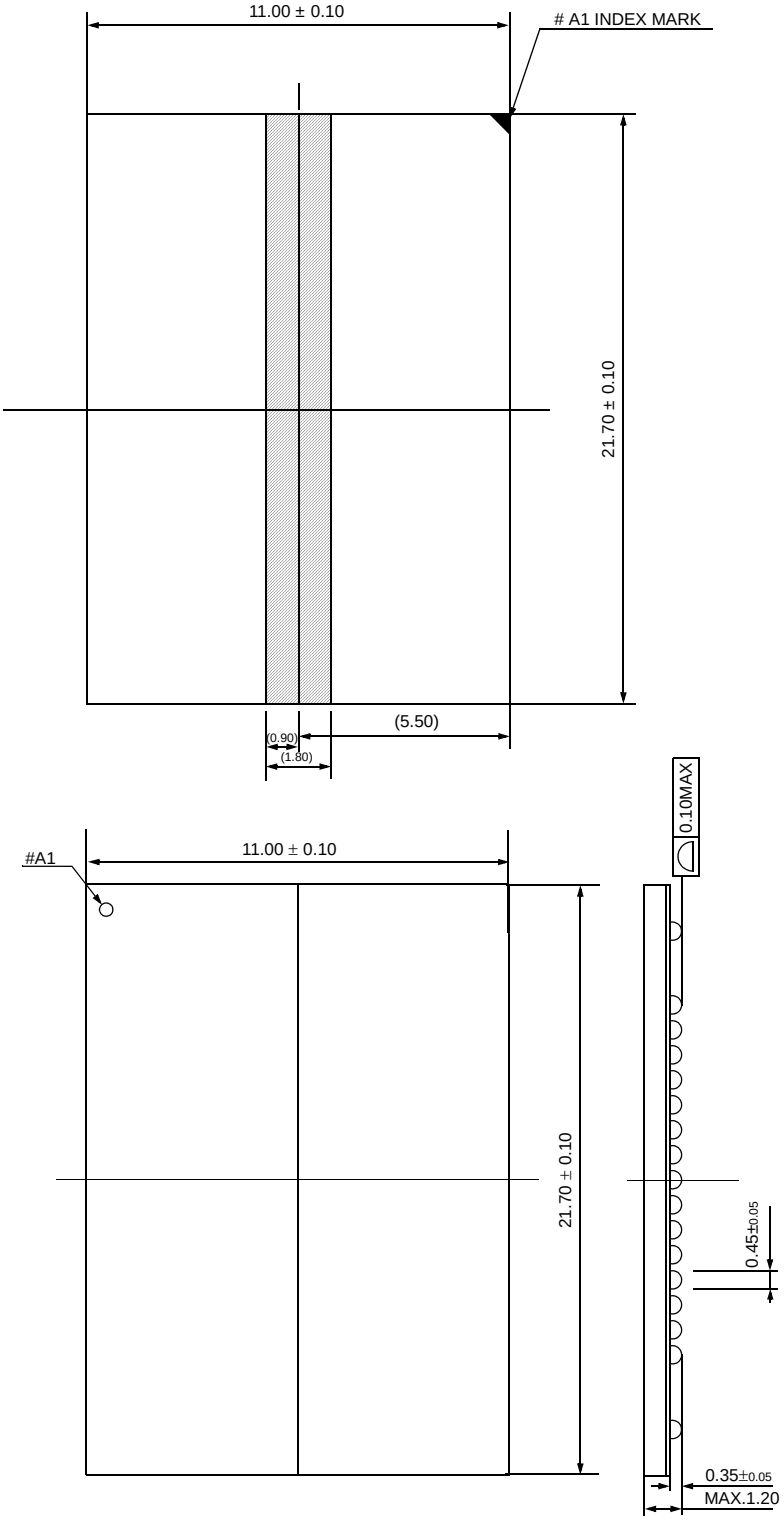
FBGA Package Dimension(x4/x8)



FBGA Package Dimension(x16)



2.2 Input/Output Functional Description

Symbol	Type	Function
CK, $\overline{CK}$	Input	**Clock:** CK and $\overline{CK}$ are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of $\overline{CK}$. Output (read) data is referenced to the crossings of CK and $\overline{CK}$ (both directions of crossing).
CKE	Input	**Clock Enable:** CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is synchronous for power down entry and exit, and for self refresh entry. CKE is asynchronous for self refresh exit. After V_{REF} has become stable during the power on and initialization swquence, it must be maintained for proper operation of the CKE receiver. For proper self-refresh entry and exit, V_{REF} must be maintained to this input. CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, $\overline{CK}$, ODT and CKE are disabled during power-down. Input buffers, excluding CKE, are disabled during self refresh.
$\overline{CS}$	Input	**Chip Select:** All commands are masked when $\overline{CS}$ is registered HIGH. $\overline{CS}$ provides for external Rank selection on systems with multiple Ranks. $\overline{CS}$ is considered part of the command code.
ODT	Input	**On Die Termination:** ODT (registered HIGH) enables termination resistance internal to the DDR2 SDRAM. When enabled, ODT is only applied to each DQ, DQS, $\overline{DQS}$, RDQS, $\overline{RDQS}$, and $\overline{DM}$ signal for x4/x8 configurations. For x16 configuration, ODT is applied to each DQ, UDQS/$\overline{UDQS}$, LDQS/$\overline{LDQS}$, UDM, and LDM signal. The ODT pin will be ignored if the Extended Mode Register Set(EMRS) is programmed to disable ODT.
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	Input	**Command Inputs:** $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ (along with $\overline{CS}$) define the command being entered.
DM	Input	**Input Data Mask:** DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading. For x8 device, the function of DM or RDQS/$\overline{RDQS}$ is enabled by EMRS command.
BA0 - BA2	Input	**Bank Address Inputs:** BA0, BA1 and BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines if the mode register or extended mode register is to be accessed during a MRS or EMRS cycle.
A0 - A13	Input	**Address Inputs:** Provided the row address for Active commands and the column address and Auto Precharge bit for Read/Write commands to select one location out of the memory array in the respective bank. A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA0, BA1 and BA2. The address inputs also provide the op-code during Mode Register Set commands.
DQ	Input/Output	**Data Input/ Output:** Bi-directional data bus.
DQS, ($\overline{DQS}$) (LDQS), ($\overline{LDQS}$) (UDQS), ($\overline{UDQS}$) (RDQS), ($\overline{RDQS}$)	Input/Output	**Data Strobe:** Output with read data, input with write data. Edge-aligned with read data, centered in write data. For the x16, LDQS corresponds to the data on DQ0-DQ7; UDQS corresponds to the data on DQ8-DQ15. For the x8, an RDQS option using DM pin can be enabled via the EMRS(1) to simplify read timing. The data strobes DQS, LDQS, UDQS, and RDQS may be used in single ended mode or paired with optional complementary signals $\overline{DQS}$, $\overline{LDQS}$, $\overline{UDQS}$, and $\overline{RDQS}$ to provide differential pair signaling to the system during both reads and writes. An EMRS(1) control bit enables or disables all complementary data strobe signals.
NC		**No Connect:** No internal electrical connection is present.
V_{DD}/V_{DDQ}	Supply	**Power Supply:** 1.8V +/- 0.1V, **DQ Power Supply:** 1.8V +/- 0.1V
V_{SS}/V_{SSQ}	Supply	**Ground**, **DQ Ground**
V_{DDL}	Supply	**DLL Power Supply:** 1.8V +/- 0.1V
V_{SSDL}	Supply	**DLL Ground**
V_{REF}	Supply	**Reference voltage**

In this data sheet, "differential DQS signals" refers to any of the following with A10 = 0 of EMRS(1)

x4 DQS/$\overline{DQS}$
x8 DQS/$\overline{DQS}$ if EMRS(1)[A11] = 0
x8 DQS/$\overline{DQS}$, RDQS/$\overline{RDQS}$, if EMRS(1)[A11] = 1
x16 LDQS/$\overline{LDQS}$ and UDQS/$\overline{UDQS}$

"single-ended DQS signals" refers to any of the following with A10 = 1 of EMRS(1)

x4 DQS
x8 DQS if EMRS(1) [A11] = 0
x8 DQS, RDQS, if EMRS(1) [A11] = 1
x16 LDQS and UDQS

2.3 1Gb Addressing

Configuration	256Mb x4	128Mb x 8	64Mb x16
# of Bank	8	8	8
Bank Address	BA0 ~ BA2	BA0 ~ BA2	BA0 ~ BA2
Auto precharge	A_{10}/AP	A_{10}/AP	A_{10}/AP
Row Address	A_0 ~ A_{13}	A_0 ~ A_{13}	A_0 ~ A_{12}
Column Address	A_0 ~ A_9,A_{11}	A_0 ~ A_9	A_0 ~ A_9

* Reference information: The following tables are address mapping information for other densities.

256Mb

Configuration	64Mb x4	32Mb x 8	16Mb x16

Column Address	A_0 ~ A_9,A_{11}	A_0 ~ A_9	A_0 ~ A_9

4Gb

Configuration	1 Gb x4	512Mb x 8	256Mb x16
# of Bank	8	8	8
Bank Address	BA0 ~ BA2	BA0 ~ BA2	BA0 ~ BA2
Auto precharge	A_{10}/AP	A_{10}/AP	A_{10}/AP
Row Address	A_0 - A_{15}	A_0 - A_{15}	A_0 - A_{14}
Column Address/page size	A_0 - A_9,A_{11}	A_0 - A_9	A_0 - A_9

3. Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
VDD	Voltage on VDD pin relative to Vss	- 1.0 V ~ 2.3 V	V	1
VDDQ	Voltage on VDDQ pin relative to Vss	- 0.5 V ~ 2.3 V	V	1
VDDL	Voltage on VDDL pin relative to Vss	- 0.5 V ~ 2.3 V	V	1
V_{IN}, V_{OUT}	Voltage on any pin relative to Vss	- 0.5 V ~ 2.3 V	V	1
T_{STG}	Storage Temperature	-55 to +100	°C	1, 2

1. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

4. AC & DC Operating Conditions

Recommended DC Operating Conditions (SSTL - 1.8)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.7	1.8	1.9	V	
VDDL	Supply Voltage for DLL	1.7	1.8	1.9	V	4
VDDQ	Supply Voltage for Output	1.7	1.8	1.9	V	4
VREF	Input Reference Voltage	0.49*VDDQ	0.50*VDDQ	0.51*VDDQ	mV	1,2
VTT	Termination Voltage	VREF-0.04	VREF	VREF+0.04	V	3

There is no specific device VDD supply voltage requirement for SSTL-1.8 compliance. However under all conditions VDDQ must be less than or equal to VDD.

1. The value of VREF may be selected by the user to provide optimum noise margin in the system. Typically the value of VREF is expected to be about 0.5 x VDDQ of the transmitting device and VREF is expected to track variations in VDDQ.
2. Peak to peak AC noise on VREF may not exceed +/-2% VREF(DC).
3. VTT of transmitting device must track VREF of receiving device.
4. AC parameters are measured with VDD, VDDQ and VDDL tied together.

Operating Temperature Condition

Symbol	Parameter	Rating	Units	Notes
TOPER	Operating Temperature	0 to 95	°C	1, 2, 3

1. Operating Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51.2 standard.
2. At 85 - 95 °C operation temperature range, doubling refresh commands in frequency to a 32ms period (tREFI=3.9 us) is required, and to enter to self refresh mode at this temperature range, an EMRS command is required to change internal refresh rate.

Input DC Logic Level

Symbol	Parameter	Min.	Max.	Units	Notes
V_{IH}(DC)	DC input logic high	VREF + 0.125	VDDQ + 0.3	V	
V_{IL}(DC)	DC input logic low	- 0.3	VREF - 0.125	V	

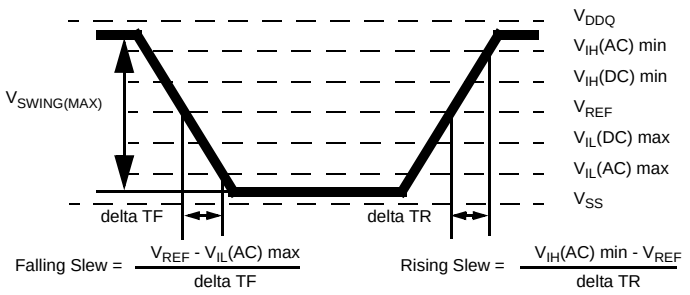
Input AC Logic Level

Symbol	Parameter	Min.	Max.	Units	Notes
V_{IH}(AC)	AC input logic high	VREF + 0.250	-	V	
V_{IL}(AC)	AC input logic low	-	VREF - 0.250	V	

AC Input Test Conditions

Symbol	Condition	Value	Units	Notes
V_{REF}	Input reference voltage	0.5 * V_{DDQ}	V	1
$V_{SWING(MAX)}$	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

Notes:
1. Input waveform timing is referenced to the input signal crossing through the $V_{IH/IL}$(AC) level applied to the device under test.
2. The input signal minimum slew rate is to be maintained over the range from V_{REF} to V_{IH}(AC) min for rising edges and the range from V_{REF} to V_{IL}(AC) max for falling edges as shown in the below figure.
3. AC timings are referenced with input waveforms switching from V_{IL}(AC) to V_{IH}(AC) on the positive transitions and V_{IH}(AC) to V_{IL}(AC) on the negative transitions.



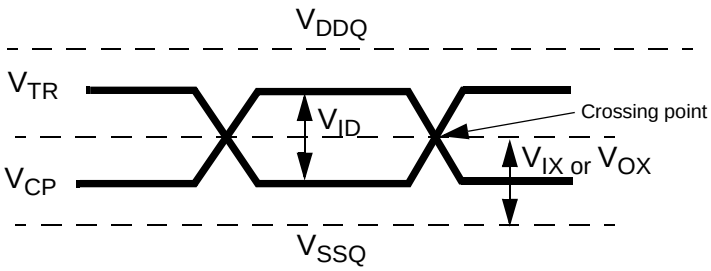
< AC Input Test Signal Waveform >

Differential input AC logic Level

Symbol	Parameter	Min.	Max.	Units	Notes
$V_{ID(AC)}$	AC differential input voltage	0.5	VDDQ + 0.6	V	1
$V_{IX(AC)}$	AC differential cross point voltage	0.5 * VDDQ - 0.175	0.5 * VDDQ + 0.175	V	2

Notes:

1. V_{ID}(AC) specifies the input differential voltage |V_{TR} -V_{CP} | required for switching, where V_{TR} is the true input signal (such as CK, DQS, LDQS or UDQS) and V_{CP} is the complementary input signal (such as $\overline{CK}$, $\overline{DQS}$, $\overline{LDQS}$ or $\overline{UDQS}$). The minimum value is equal to V_{IH}(AC) - V_{IL}(AC).
2. The typical value of V_{IX}(AC) is expected to be about 0.5 * VDDQ of the transmitting device and V_{IX}(AC) is expected to track variations in VDDQ . V_{IX}(AC) indicates the voltage at which differential input signals must cross.



< Differential signal levels >

Differential AC output parameters

Symbol	Parameter	Min.	Max.	Units	Note
V_{OX}(AC)	AC differential cross point voltage	0.5 * VDDQ - 0.125	0.5 * VDDQ + 0.125	V	1

Note :
1. The typical value of V_{OX}(AC) is expected to be about 0.5 * VDDQ of the transmitting device and V_{OX}(AC) is expected to track variations in VDDQ . V_{OX}(AC) indicates the voltage at which differential output signals must cross.

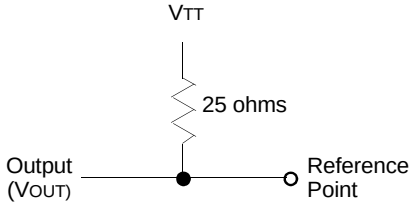
OCD default characteristics

Description	Parameter	Min	Nom	Max	Unit	Notes
Output impedance		12.6	18	23.4	ohms	1,2
Output impedance step size for OCD calibration		0		1.5	ohms	6
Pull-up and pull-down mismatch		0		4	ohms	1,2,3
Output slew rate	Sout	1.5		5	V/ns	1,4,5,6,7,8

Notes:

1. Absolute Specifications (0°C ≤ T_{CASE} ≤ +95°C; VDD = +1.8V ±0.1V, VDDQ = +1.8V ±0.1V)
2. Impedance measurement condition for output source dc current: VDDQ = 1.7V; VOUT = 1420mV; (VOUT-VDDQ)/Ioh must be less than 23.4 ohms for values of VOUT between VDDQ and VDDQ-280mV. Impedance measurement condition for output sink dc current: VDDQ = 1.7V; VOUT = 280mV; VOUT/Iol must be less than 23.4 ohms for values of VOUT between 0V and 280mV.
3. Mismatch is absolute value between pull-up and pull-dn, both are measured at same temperature and voltage.
4. Slew rate measured from V_{IL}(AC) to V_{IH}(AC).
5. The absolute value of the slew rate as measured from DC to DC is equal to or greater than the slew rate as measured from AC to AC. This is guaranteed by design and characterization.
6. This represents the step size when the OCD is near 18 ohms at nominal conditions across all process and represents only the DRAM uncertainty.

Output slew rate load :



7. DRAM output slew rate specification applies to 400Mb/sec/pin and 533Mb/sec/pin speed bins.
8. Timing skew due to DRAM output slew rate mis-match between DQS / $\overline{DQS}$ and associated DQs is included in tDQSQ and tQHS specification.

IDD Specification Parameters and Test Conditions

(IDD values are for full operating range of Voltage and Temperature, Notes 1 - 5)

Symbol	Proposed Conditions		Units	Notes
IDD0	**Operating one bank active-precharge current**; $^{t}CK = ^{t}CK(IDD)$, $^{t}RC = ^{t}RC(IDD)$, $^{t}RAS = ^{t}RASmin(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING		mA	
IDD1	**Operating one bank active-read-precharge current**; IOUT = 0mA; BL = 4, CL = CL(IDD), AL = 0; $^{t}CK = ^{t}CK(IDD)$, $^{t}RC = ^{t}RC(IDD)$, $^{t}RAS = ^{t}RASmin(IDD)$, $^{t}RCD = ^{t}RCD(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Address bus inputs are SWITCHING; Data pattern is same as IDD4W		mA	
IDD2P	**Precharge power-down current**; All banks idle; $^{t}CK = ^{t}CK(IDD)$; CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING		mA	
IDD2Q	**Precharge quiet standby current**; All banks idle; $^{t}CK = ^{t}CK(IDD)$; CKE is HIGH, CS\ is HIGH; Other control and address bus inputsare STABLE; Data bus inputs are FLOATING		mA	
IDD2N	**Precharge standby current**; All banks idle; $^{t}CK = ^{t}CK(IDD)$; CKE is HIGH, CS\ is HIGH; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING		mA	
IDD3P	**Active power-down current**; All banks open; $^{t}CK = ^{t}CK(IDD)$; CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING	Fast PDN Exit MRS(12) = 0mA	mA	
		Slow PDN Exit MRS(12) = 1mA	mA	
IDD3N	**Active standby current**; All banks open; $^{t}CK = ^{t}CK(IDD)$, $^{t}RAS = ^{t}RASmax(IDD)$, $^{t}RP = ^{t}RP(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING		mA	
IDD4W	**Operating burst write current**; All banks open, Continuous burst writes; BL = 4, CL = CL(IDD), AL = 0; $^{t}CK = ^{t}CK(IDD)$, $^{t}RAS = ^{t}RASmax(IDD)$, $^{t}RP = ^{t}RP(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING		mA	
IDD4R	**Operating burst read current**; All banks open, Continuous burst reads, IOUT = 0mA; BL = 4, CL = CL(IDD), AL = 0; $^{t}CK = ^{t}CK(IDD)$, $^{t}RAS = ^{t}RASmax(IDD)$, $^{t}RP = ^{t}RP(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Address bus inputs are SWITCHING; Data pattern is same as IDD4W		mA	
IDD5B	**Burst auto refresh current**; $^{t}CK = ^{t}CK(IDD)$; Refresh command at every $^{t}RFC(IDD)$ interval; CKE is HIGH, CS\ is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING		mA	
IDD6	**Self refresh current**; CK and CK\ at 0V; CKE ≤ 0.2V; Other control and address bus inputs are FLOATING; Data bus inputs are FLOATING	Normal	mA	
		Low Power	mA	
IDD7	**Operating bank interleave read current**; All bank interleaving reads, IOUT = 0mA; BL = 4, CL = CL(IDD), AL = $^{t}RCD(IDD)-1*^{t}CK(IDD)$; $^{t}CK = ^{t}CK(IDD)$, $^{t}RC = ^{t}RC(IDD)$, $^{t}RRD = ^{t}RRD(IDD)$, $^{t}RCD = 1*^{t}CK(IDD)$; CKE is HIGH, CS\ is HIGH between valid commands; Address bus inputs are STABLE during DESELECTs; Data pattern is same as IDD4R; Refer to the following page for detailed timing conditions		mA	

Notes :

1. IDD specifications are tested after the device is properly initialized
2. Input slew rate is specified by AC Parametric Test Condition
3. IDD parameters are specified with ODT disabled.
4. Data bus consists of DQ, DM, DQS, DQS\, RDQS, RDQS\, LDQS, LDQS\, UDQS, and UDQS\. IDD values must be met with all combinations of EMRS bits 10 and 11.
5. Definitions for IDD
   - LOW is defined as Vin ≤ VILAC(max)
   - HIGH is defined as Vin ≥ VIHAC(min)
   - STABLE is defined as inputs stable at a HIGH or LOW level
   - FLOATING is defined as inputs at VREF = VDDQ/2
   - SWITCHING is defined as:
     - inputs changing between HIGH and LOW every other clock cycle (once per two clocks) for address and control signals, and
     - inputs changing between HIGH and LOW every other data transfer (once per clock) for DQ signals not including masks or strobes.

For purposes of IDD testing, the following parameters are utilized

	DDR2-533	DDR2-400	
Parameter	**4-4-4**	**3-3-3**	**Units**
CL(IDD)	4	3	tCK
$t_{RCD(IDD)}$	15	15	ns
$t_{RC(IDD)}$	60	55	ns
$t_{RRD(IDD)}$-x4/x8	7.5	7.5	ns
$t_{RRD(IDD)}$-x16	10	10	ns
$t_{CK(IDD)}$	3.75	5	ns
$t_{RASmin(IDD)}$	45	40	ns
$t_{RP(IDD)}$	15	15	ns
$t_{RFC(IDD)}$	127.5	127.5	ns

Detailed IDD7

The detailed timings are shown below for IDD7.
Legend: A = Active; RA = Read with Autoprecharge; D = Deselect

IDD7: Operating Current: All Bank Interleave Read operation

All banks are being interleaved at minimum $t_{RC(IDD)}$ without violating $t_{RRD(IDD)}$ using a burst length of 4. Control and address bus inputs are STABLE during DESELECTs. IOUT = 0mA

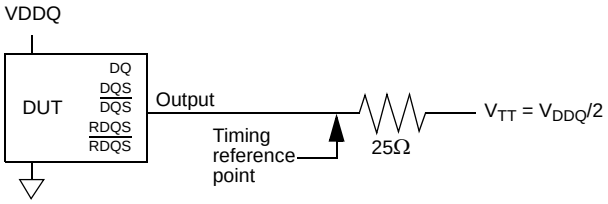
General notes, which may apply for all AC parameters

1. Slew Rate Measurement Levels
   a. Output slew rate for falling and rising edges is measured between VTT - 250 mV and VTT + 250 mV for single ended signals. For differential signals (e.g. DQS - $\overline{DQS}$) output slew rate is measured between DQS - $\overline{DQS}$ = -500 mV and DQS - $\overline{DQS}$ = +500mV. Output slew rate is guaranteed by design, but is not necessarily tested on each device.
   b. Input slew rate for single ended signals is measured from dc-level to ac-level: from V_{IL}(dc) to V_{IH}(ac) for rising edges and from V_{IH}(dc) and V_{IL}(ac) for falling edges.
   For differential signals (e.g. CK - $\overline{CK}$) slew rate for rising edges is measured from CK - $\overline{CK}$ = -250 mV to CK - $\overline{CK}$ = +500 mV (250mV to -500 mV for falling edges).
   c. VID is the magnitude of the difference between the input voltage on CK and the input voltage on $\overline{CK}$, or between DQS and $\overline{DQS}$ for differential strobe.

2. DDR2 SDRAM AC timing reference load

Following figure represents the timing reference load used in defining the relevant timing parameters of the part. It is not intended to be either a precise representation of the typical system environment or a depiction of the actual load presented by a production tester. System designers will use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers will correlate to their production test conditions (generally a coaxial transmission line terminated at the tester electronics).

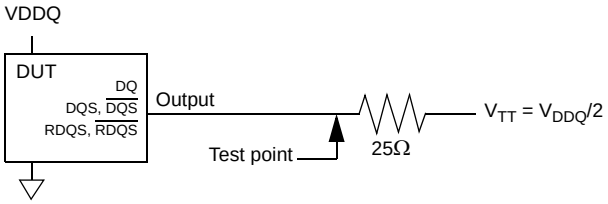


<AC Timing Reference Load>

The output timing reference voltage level for single ended signals is the crosspoint with VTT. The output timing reference voltage level for differential signals is the crosspoint of the true (e.g. DQS) and the complement (e.g. DQS) signal.

3. DDR2 SDRAM output slew rate test load

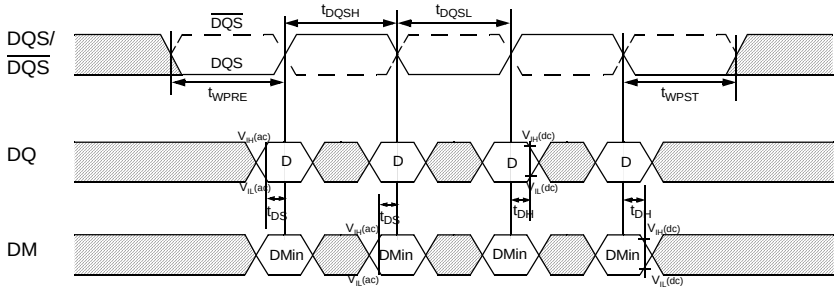
Output slew rate is characterized under the test conditions as shown in the following figure.



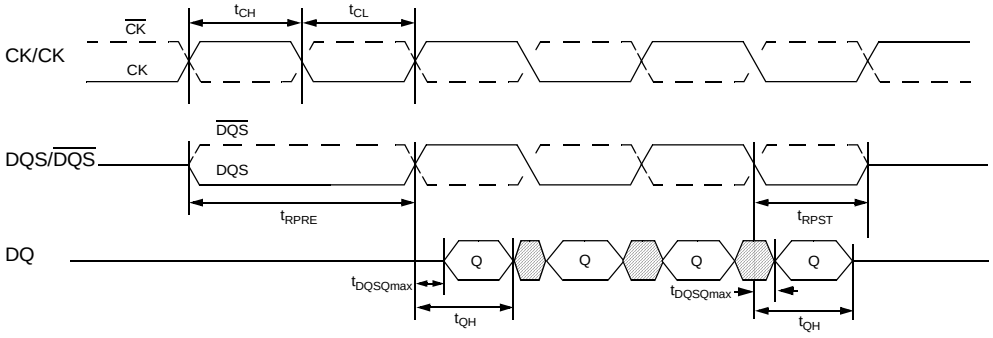
<Slew Rate Test Load>

4. Differential data strobe

DDR2 SDRAM pin timings are specified for either single ended mode or differential mode depending on the setting of the EMRS “Enable DQS” mode bit; timing advantages of differential mode are realized in system design. The method by which the DDR2 SDRAM pin timings are measured is mode dependent. In single ended mode, timing relationships are measured relative to the rising or falling edges of DQS crossing at VREF. In differential mode, these timing relationships are measured relative to the crosspoint of DQS and its complement, $\overline{DQS}$. This distinction in timing methods is guaranteed by design and characterization. Note that when differential data strobe mode is disabled via the EMRS, the complementary pin, $\overline{DQS}$, must be tied externally to VSS through a 20 ohm to 10 K ohm resisor to insure proper operation.



<Data input (write) timing>



<Data output (read) timing>

5. AC timings are for linear signal transitions.

6. These parameters guarantee device behavior, but they are not necessarily tested on each device. They may be guaranteed by device design or tester correlation.

7. All voltages are referenced to VSS.

8. Tests for AC timing, IDD, and electrical (AC and DC) characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.

Specific Notes for dedicated AC parameters

9. User can choose which active power down exit timing to use via MRS(bit 12). tXARD is expected to be used for fast active power down exit timing. tXARDS is expected to be used for slow active power down exit timing.

10. AL = Additive Latency

11. This is a minimum requirement. Minimum read to precharge timing is AL + BL/2 providing the tRTP and tRAS(min) have been satisfied.

12. A minimum of two clocks (2 * tCK) is required irrespective of operating frequency

13. Timings are guaranteed with command/address input slew rate of 1.0 V/ns.

14. These parameters guarantee device behavior, but they are not necessarily tested on each device. They may be guaranteed by device design or tester correlation.

15. Timings are guaranteed with data, mask, and (DQS/RDQS in singled ended mode) input slew rate of 1.0 V/ns.

16. Timings are guaranteed with CK/$\overline{CK}$ differential slew rate of 2.0 V/ns. Timings are guaranteed for DQS signals with a differential slew rate of 2.0 V/ns in differential strobe mode and a slew rate of 1V/ns in single ended mode.

17. tDS and tDH derating for DDR2-400 and DDR2-533

ΔtDS, ΔtDH Derating Values (ALL units in 'ps', Note 1 applies to entire Table)

		DQS,$\overline{DQS}$ Differential Slew Rate																	
		4.0 V/ns		3.0 V/ns		2.0 V/ns		1.8 V/ns		1.6 V/ns		1.4V/ns		1.2V/ns		1.0V/ns		0.8V/ns	
		ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH	ΔtDS	ΔtDH
DQ Slew rate V/ns	2.0	125	45	125	45	125	45	-	-	-	-	-	-	-	-	-	-	-	-
	1.5	83	21	83	21	83	21	95	33	-	-	-	-	-	-	-	-	-	-
	1.0	0	0	0	0	0	0	12	12	24	24	-	-	-	-	-	-	-	-
	0.9	-	-	-11	-14	-11	-14	1	-2	13	10	25	22	-	-	-	-	-	-
	0.8	-	-	-	-	-25	-31	-13	-19	-1	-7	11	5	23	17	-	-	-	-
	0.7	-	-	-	-	-	-	-31	-42	-19	-30	-7	-18	5	-6	17	6	-	-
	0.6	-	-	-	-	-	-	-	-	-43	-59	-31	-47	-19	-35	-7	-23	5	-11
	0.5	-	-	-	-	-	-	-	-	-	-	-74	-89	-62	-77	-50	-65	-38	-53
	0.4	-	-	-	-	-	-	-	-	-	-	-	-	-127	-140	-115	-128	-103	-116

For all input signals the total tDS (setup time) and tDH (hold time) required is calculated by adding the datasheet tDS(base) and tDH(base) value to the delta tDS and delta tDH derating value respectively. Example: tDS (total setup time) = tDS(base) + delta tDS.

18. tIS and tIH (input setup and hold) derating.

tIS, tIH Derating Values for DDR2-400, DDR2-533

For all input signals the total tIS (setup time) and tIH (hold time) required is calculated by adding the datasheet tIS(base) and tIH(base) value to the delta tIS and delta tIH derating value respectively. Example: tIS (total setup time) = tIS(base) + delta tIS

19. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.

20. MIN (tCL, tCH) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for tCL and tCH). For example, tCL and tCH are = 50% of the period, less the half period jitter (tJIT(HP)) of the clock source, and less the half period jitter due to crosstalk (tJIT(crosstalk)) into the clock traces.

21. tQH = tHP – tQHS, where:
tHP = minimum half clock period for any given cycle and is defined by clock high or clock low (tCH, tCL).
tQHS accounts for:
1) The pulse duration distortion of on-chip clock circuits; and
2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are, separately, due to data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers.

22. tDQSQ: Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output slew rate mismatch between DQS / $\overline{\text{DQS}}$ and associated DQ in any given cycle.

23. DAL = WR + RU{tRP(ns)/tCK(ns)}, where RU stands for round up.
WR refers to the tWR parameter stored in the MRS. For tRP, if the result of the division is not already an integer, round up to the next highest integer. tCK refers to the application clock period.
Example: For DDR533 at tCK = 3.75ns with tWR programmed to 4 clocks.
tDAL = 4 + (15 ns / 3.75 ns) clocks = 4 + (4) clocks = 8 clocks.

24. The clock frequency is allowed to change during self–refresh mode or precharge power-down mode. In case of clock frequency change during precharge power-down, a specific procedure is required as described in DDR2 device operation

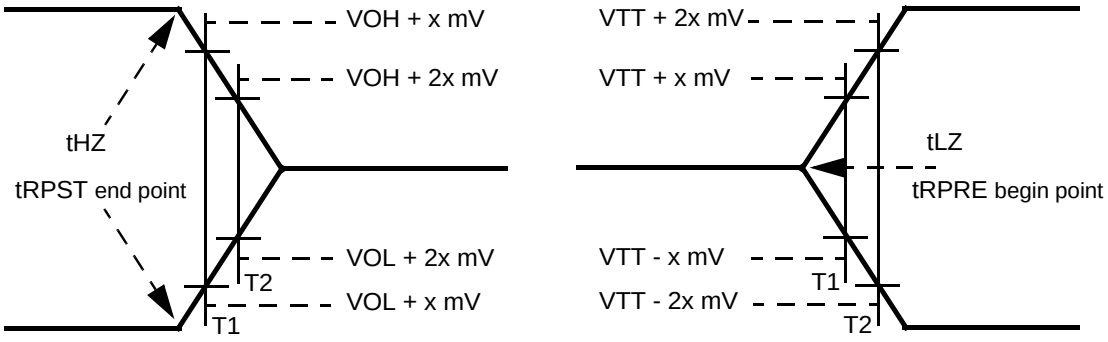
25. ODT turn on time min is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from tAOND.

26. ODT turn off time min is when the device starts to turn off ODT resistance.
ODT turn off time max is when the bus is in high impedance. Both are measured from tAOFD.

27. tHZ and tLZ transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving (tHZ), or begins driving (tLZ). Following figure shows a method to calculate the point when device is no longer driving (tHZ), or begins driving (tLZ) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent.

28. tRPST end point and tRPRE begin point are not referenced to a specific voltage level but specify when the device output is no longer driving (tRPST), or begins driving (tRPRE). Following figure shows a method to calculate these points when the device is no longer driving (tRPST), or begins driving (tRPRE) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the cal-

culation is consistent.
These notes are referenced in the “Timing parameters by speed grade” tables for DDR2-400/533/667 and DDR2-800.



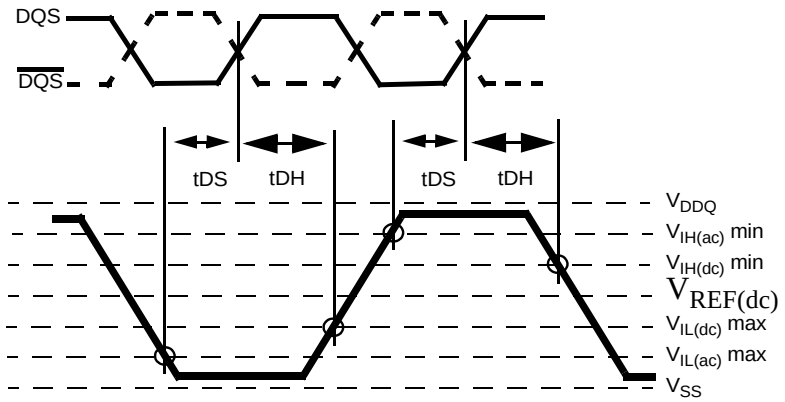
tHZ,tRPST end point = 2*T1-T2 tLZ,tRPRE begin point = 2*T1-T2

<Test method for tLZ, tHZ, tRPRE and tRPST>

29. Input waveform timing with differential data strobe enabled MR[bit10]=0, is referenced from the input signal crossing at the $V_{IH(ac)}$ level to the differential data strobe crosspoint for a rising signal, and from the input signal crossing at the $V_{IL(ac)}$ level to the differential data strobe crosspoint for a falling signal applied to the device under test.

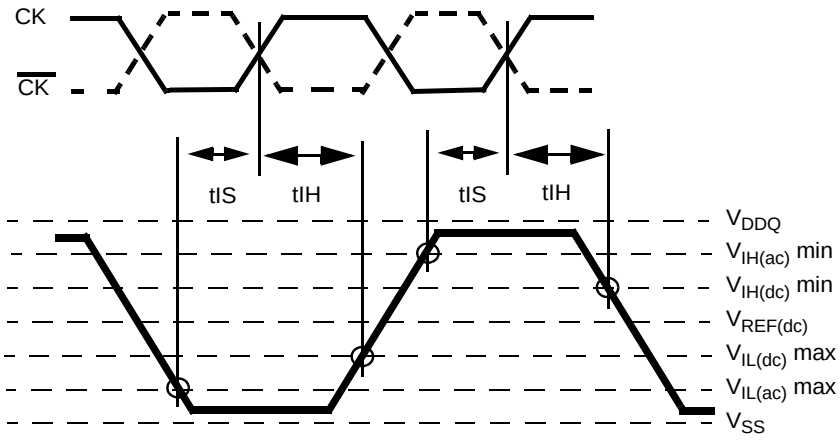
30. Input waveform timing with differential data strobe enabled MR[bit10]=0, is referenced from the input signal crossing at the $V_{IH(dc)}$ level to the differential data strobe crosspoint for a rising signal and $V_{IL(dc)}$ to the differential data strobe crosspoint for a falling signal applied to the device under test.

Differential Input waveform timing



31. Input waveform timing is referenced from the input signal crossing at the $V_{IH(ac)}$ level for a rising signal and $V_{IL(ac)}$ for a falling signal applied to the device under test.

32. Input waveform timing is referenced from the input signal crossing at the $V_{IH(dc)}$ level for a rising signal and $V_{IL(dc)}$ for a falling signal applied to the device under test.



33. tWTR is at lease two clocks (2 * tCK) independent of operation frequency.

34. Input waveform timing with single-ended data strobe enabled MR[bit10] = 1, is referenced from the input signal crossing at the VIH(ac) level to the single-ended data strobe crossing VIH/L(dc) at the start of its transition for a rising signal, and from the input signal crossing at the VIL(ac) level to the single-ended data strobe crossing VIH/L(dc) at the start of its transition for a falling signal applied to the device under test. The DQS signal must be monotonic between Vil(dc)max and Vih(dc)min.

35. Input waveform timing with single-ended data strobe enabled MR[bit10] = 1, is referenced from the input signal crossing at the VIH(dc) level to the single-ended data strobe crossing VIH/L(ac) at the end of its transition for a rising signal, and from the input signal crossing at the VIL(dc) level to the single-ended data strobe crossing VIH/L(ac) at the end of its transition for a falling signal applied to the device under test. The DQS signal must be monotonic between Vil(dc)max and Vih(dc)min.

36. tCKEmin of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registeration. Thus, after any cKE transition, CKE may not transitioin from its valid level during the time period of tIS + 2*tCK + tIH.

Revision History

Version 0.1 (Feb. 2004)
- Initial Release

Version 0.2 (May 2004)
- Corrected the Ordering Information

Version 0.3 (Jul. 2004)
- Corrected Typo

Version 1.0 (Dec. 2004)
- Added current values at DDR2-400

Version 1.1 (Jan. 2005)
- Revised current test AC spec condition
- Added derating table
