

KS2508

OSD PROCESSOR FOR MONITOR

OVERVIEW

The KS2508 is used to display some characters or symbols on a screen of monitor. Basically, the operation is to control the internal memory on chip and generate the R,G,B signals for some characters or symbols. The R,G,B signals are synchronized with the horizontal sync. Then the R,G,B signals are mixed with the main video signal in the Video Amp IC. The font data for characters or symbols are stored in the internal ROM. This stored data are accessed and controlled by the control data from a micro controller. The control data are transmitted through the I²C bus. All timing control signals including the system clock are synchronized with the horizontal sync. Therefore there is a PLL circuitry on chip.

16-DIP-300

FEATURES

- 256 ROM fonts (Each font consists of 12 x 18 dots.)
- Full Screen Memory Architecture
- Wide range PLL available (15 kHz ~ 120 kHz)
- Programmable vertical height of character
- Programmable vertical and horizontal positioning
- Character color selection up to 16 different colors
- Programmable background color (Up to 16 colors)
- Character blinking, bordering and shadowing
- Color blinking
- Character scrolling
- Fade-in and fade-out
- Box drawing
- Character sizing up to four times
- 96 MHz pixel frequency from on-chip PLL
- IIC Protocol Data Transmission (Slave Address : BAH)

ORDERING INFORMATION

Device	Package	Operating Temperature
KS2508	16-DIP-300	0°C ~ 70°C

FUNCTIONAL DESCRIPTIONS

Data Transmission to the KS2508

According to the I²C protocol, the KS2508 receives the data from a micro controller. The SDA line and the SCL line are shown in Figure 4. As shown in Figure 4, after the starting pulse, the slave address with R/W* bit and an acknowledge are transmitted in sequence, an internal register address of the KS2508 is followed. The first 8-bit byte is the upper 8bits of the register address. The lower 8bits of the register address are followed after the second acknowledge. There is a data transmission format and are two address bit patterns in the KS2508 as following. The slave address of the KS2508 is BAH(in hexadecimal).

Data Transmission Format

Row Address -> Column Address -> Data Byte N -> Data Byte N+1 -> Data Byte N+2 ->

Address Bit Pattern for Display Registers Data

(a) Row Address Bit Pattern R3 - R0: Valid Data for Row Address

A15	A14	A13	A12	A11	A10	A9	A8
X	X	X	X	R3	R2	R1	R0

(b) Column Address Bit Pattern C4 - C0: Valid Data for Column Address

A7	A6	A5	A4	A3	A2	A1	A0
X	X	X	C4	C3	C2	C1	C0

After addressing, data bytes are followed as the above data transmission format. The Figure 4 describes the data transmission with the I²C bus protocol.

Figure 4. SDA line and SCL line (Write Operation)

Memory Map

The display RAM is addressed with the row and column number in sequence. The display RAM consists of four register groups: Character & Attribute Registers, Row Attribute Registers and Frame Control Registers-

As the display area in a monitor screen is 30 columns by 15 rows, the related Character & Attribute Registers are also 30 columns by 15 rows. Each register contains a character address and an attribute corresponding to display location on a monitor screen. And one register is composed of 16 bits. The lower 8 bits select characters out of 256 ROM fonts. The upper 7 bits are assigned to give a character attribute to a selected font. Row Attribute Registers occupy the 31th column of Display RAM and provide the row attribute of a blank mode, raster color, raster color intensity, character color intensity, horizontal character size, vertical character size.

Frame Control Registers are located at the 16th row. The content of each register is described in Figure 5 and following register set.

Figure 5. Memory Map of Display Registers

ROM Fonts

KS2508 is able to supply 256 single-color ROM fonts for describing an OSD icon. So a multi-language OSD icon can be generated. The standard font \$00 is reserved for blank data.

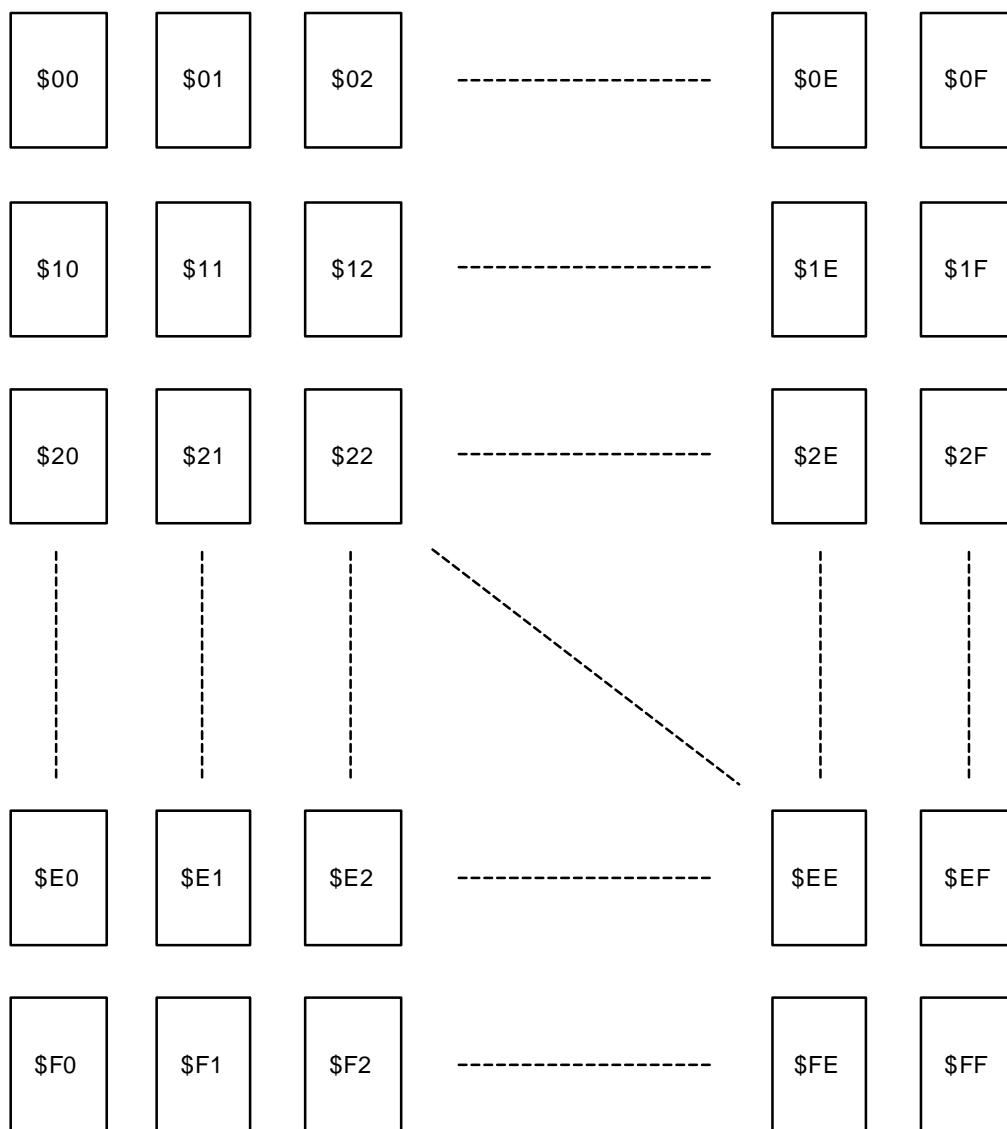

Figure 6. Array of ROM Fonts

Scroll

The scrolling function is to display or erase a character slowly from the top line to the bottom. The scrolling time is controlled by 'ScrT' bit of the frame control registers. If 'ScrT' bit is high, then the time is 0.5 sec. Otherwise, 1 sec.

Character Bordering & Shadowing

Bordering

Shadowing

Character Height Control

Two examples of the height-controlled character are shown in the following figure. The height control is performed by repeating some lines. The repeating line-number comes from the equation below.

$$\begin{aligned} &[\# \text{ of the repeating lines} = 2 + N \times M], \\ &\text{where } N = 1, 2, 3, \dots \text{ and } M = \text{round}\{14 \div (\text{CH}[5:0] - 18)\}. \end{aligned}$$

If the M value is less than or equal to 1, all the lines of the standard font are repeated once or more. This is described as following.

(i) If CH[5:0] is greater than 32, and less than or equal to 46 ($32 < \text{CH}[5:0] \leq 46$), then all lines are repeated once or twice. The lines repeated twice are selected by the following equation.

$$\begin{aligned} &[\# \text{ of the repeating lines} = 2 + N \times M], \\ &\text{where } N = 1, 2, 3, \dots \text{ and } M = \text{round}\{14 \div (\text{CH}[5:0] - 32)\}. \end{aligned}$$

(ii) If CH[5:0] is greater than 46, and less than or equal to 60 ($46 < \text{CH}[5:0] \leq 60$), then all lines are repeated twice or three times. The lines repeated three times are selected by the following equation.

$$\begin{aligned} &[\# \text{ of the repeating lines} = 2 + N \times M], \\ &\text{where } N = 1, 2, 3, \dots \text{ and } M = \text{round}\{14 \div (\text{CH}[5:0] - 46)\}. \end{aligned}$$

iii) If CH[5:0] is greater than 60, and less than or equal to 64 ($60 < \text{CH}[5:0] \leq 64$), then all lines are repeated three or four times. The lines repeated four times are selected by the following equation.

$$\begin{aligned} &[\# \text{ of the repeating lines} = 2 + N \times M], \\ &\text{where } N = 1, 2, 3, \dots \text{ and } M = \text{round}\{14 \div (\text{CH}[5:0] - 60)\}. \end{aligned}$$

The repeating line-number is limited to 16.

FRAME CONTROL & TIMING

Figure 7 shows the composition of display frame with the OSD characters.

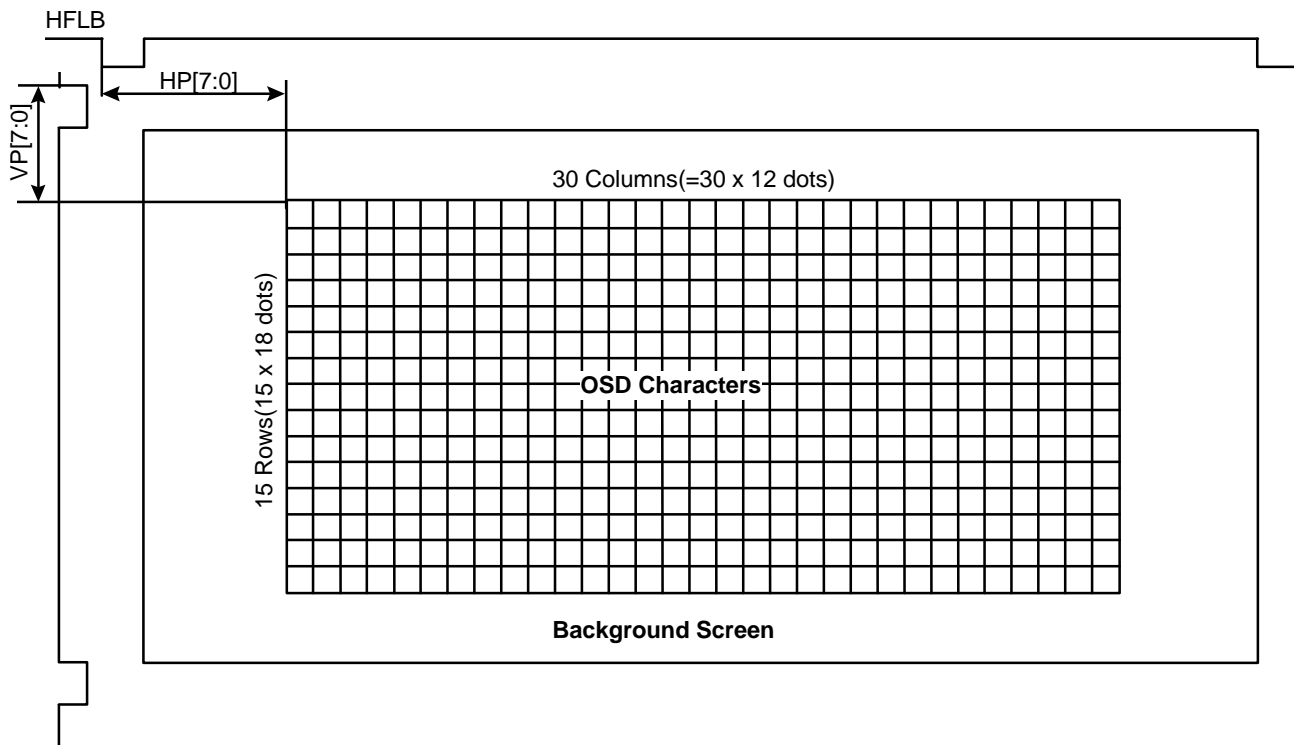

Figure 7. Frame Composition with the OSD Characters

User can determine the dot frequency by the equation of H freq. x the number of horizontal resolution. And the number of horizontal resolution is determined by the bit9 - 8 (dot 1, dot 0) of the frame Control registers-1. If dot 0 = '0', dot 1 = '0', then the dot frequency is calculated by the equation of H freq. $\times 320$. If the H freq. = 15 kHz, then the dot frequency is $15 \text{ kHz} \times 320 = 4.8 \text{ MHz}$. If dot 0 = '1', dot 1 = '1' and the horizontal frequency is 120 kHz, then the dot frequency is $120 \text{ kHz} \times 800 = 96 \text{ MHz}$. 96 MHz is the maximum clock frequency in this processor.

Table 4. Register Description

Registers	Bits	Description																																			
Character & Attribute Register (Row 00~14, Column 00~29)	C7~C0 (Bit 7~0)	Character Code Address of 256 ROM Fonts.																																			
	Blink/FINT (Bit 9)	<p>Character Blinking/Font Intensity Enable. If INTE'bit is low, this bit control blinking effect. The blinking period is set by the 'BliT' bit and the duty is selected by the 'Bli0' and ' Bli1' bits. If INTE'bit is high, this bit control the font intensity combined with INTE,' RINT'and CINT'as following table.</p> <table border="1"> <thead> <tr> <th>INTE</th> <th>Blink/FINT</th> <th>RINT</th> <th>CINT</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>-</td> <td>-</td> <td>Normal</td> </tr> <tr> <td>0</td> <td>1</td> <td>-</td> <td>-</td> <td>Blink</td> </tr> <tr> <td>1</td> <td>0</td> <td>-</td> <td>-</td> <td>Normal(No Intensity)</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>1</td> <td>Character Intensity</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>0</td> <td>Raster Intensity</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>1</td> <td>Character & Raster Intensity</td> </tr> </tbody> </table>	INTE	Blink/FINT	RINT	CINT	Function	0	0	-	-	Normal	0	1	-	-	Blink	1	0	-	-	Normal(No Intensity)	1	1	0	1	Character Intensity	1	1	1	0	Raster Intensity	1	1	1	1	Character & Raster Intensity
	INTE	Blink/FINT	RINT	CINT	Function																																
	0	0	-	-	Normal																																
	0	1	-	-	Blink																																
1	0	-	-	Normal(No Intensity)																																	
1	1	0	1	Character Intensity																																	
1	1	1	0	Raster Intensity																																	
1	1	1	1	Character & Raster Intensity																																	
B,G,R (Bit C~A)	Character color is determined by these bits. 8 colors can be selected and the color intensity of a character is given by 'CINT' bit of Row Attribute Registers. So user can select up to 16 colors.																																				
BOX 1, BOX0 (Bit E, D)	<p>Character Box Drawing. The combinations of this two bits generate four different box drawing modes as following. The following example is the case that box dawning is activated with the font 'A'</p> <table border="1"> <tr> <td></td> <td>BOX0</td> <td>0</td> <td>1</td> </tr> <tr> <td>BOX1</td> <td>0</td> <td>BOX OFF </td> <td></td> </tr> <tr> <td>1</td> <td></td> <td></td> <td></td> </tr> </table>		BOX0	0	1	BOX1	0	BOX OFF 		1																											
	BOX0	0	1																																		
BOX1	0	BOX OFF 																																			
1																																					
	* Bit F~D(RB/RG/RR) is also used for raster color by setting the 'BOXE' bit low. if the 'BOXE' bit is low,Raster color of a font is determined by this bits . Priority of raster color selected here is higher than that of row attribute.																																				
BINV (Bit F)	<p>Box Inversion. The box drawing activated by the bit E and D is changed to white box from black and conversely.</p>																																				

Table 4. Register Description (Continued)

Registers	Bits	Description													
Row Attribute Register (Row 00 ~ 14, Column 30)	VZ1,VZ0 (Bit 1, 0)	Vertical Character Size Control. Vertical character size is determined by the combinations of this two bits as following table.													
		<table border="1"> <thead> <tr> <th>VZ1</th> <th>VZ0</th> <th>Vertical Character Size</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>1X</td> </tr> <tr> <td>0</td> <td>1</td> <td>2X</td> </tr> <tr> <td>1</td> <td>0</td> <td>3X</td> </tr> <tr> <td>1</td> <td>1</td> <td>4X</td> </tr> </tbody> </table>	VZ1	VZ0	Vertical Character Size	0	0	1X	0	1	2X	1	0	3X	1
VZ1	VZ0	Vertical Character Size													
0	0	1X													
0	1	2X													
1	0	3X													
1	1	4X													
	HZ1,HZ0 (Bit 3, 2)	Horizontal Character Size Control. The horizontal character size is determined by the combinations of this two bits as following table.													
		<table border="1"> <thead> <tr> <th>HZ1</th> <th>HZ0</th> <th>Horizontal Character Size</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>1X</td> </tr> <tr> <td>0</td> <td>1</td> <td>2X</td> </tr> <tr> <td>1</td> <td>0</td> <td>3X</td> </tr> <tr> <td>1</td> <td>1</td> <td>4X</td> </tr> </tbody> </table>	HZ1	HZ0	Horizontal Character Size	0	0	1X	0	1	2X	1	0	3X	1
HZ1	HZ0	Horizontal Character Size													
0	0	1X													
0	1	2X													
1	0	3X													
1	1	4X													
	CINT (Bit 4)	Character Color Intensity. If INTE'bit and this bit is set, the color intensity of characters setting FINT'bit in the same row is high.													
	RINT (Bit 5)	Raster Color Intensity. If INTE'bit and this bit is set, the color intensity of rasters setting FINT'bit in the same row is high.													
	RB, RG, RR (Bit 8~6)	Raster Color is determined by these bits. 8 colors can be selected and the color intensity of a character is given by RINT'bit of Row Attribute Registers. So it can be selected up to 16 colors.													
	SHA	Character Shadowing. Set this bit to activate characters shadowing.													
	BORD	Character Bordering. Set this bit to activate characters shadowing.													
	BOXE (Bit B)	BOX Enable. If this bit is set, Bit F-D in the Character & Attribute Registers are used for the box-drawing function. Otherwise, those are used for raster color of a font. Even though the raster color attribute is given by Bit 8-6 in the row attribute registers, the priority of Bit F-D in the character & attribute registers is higher.													
	CBli (Bit C)	Color Blink Enable. If this bit is high, color blinking effect is activated. The effect is to repeat color inversion between character and raster. Color blinking time and the duty is controlled by Bil T, Bil 1 and Bli 0.													
	INTE (Bit D)	Intensity Enable. If this bit is set, the function of RINT and CINT bit are enabled and the bit 9 of Character & Attribute Register control the font intensity effect. Otherwise, all intensity functions are disabled and the bit 9 of Character & Attribute Register control the blinking effect.													
	BREN (Bit E)	Back Raster Blank Enable. If this bit is high and the raster color is black, the raster is transparent													
	Bit F	Reserved													

Table 4. Register Description (Continued)

Registers	Bits	Description															
Frame Control Register 0 (Row 15, Column 00)	Bli T (Bit 0)	Blink Time Control. If this bit is high, the blink time is 0.5 sec. Otherwise, 1 sec.															
	Bli 1, Bli 0 (Bit 2, 1)	Blinking Duty Control. The blinking duty is controlled by the combination of this two bits as following. <table border="1" data-bbox="635 667 1283 904"> <thead> <tr> <th>Bli 1</th> <th>Bli 0</th> <th>Blinking Duty</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Blink Off</td> </tr> <tr> <td>0</td> <td>1</td> <td>Duty 25%</td> </tr> <tr> <td>1</td> <td>0</td> <td>Duty 50%</td> </tr> <tr> <td>1</td> <td>1</td> <td>Duty 75%</td> </tr> </tbody> </table>	Bli 1	Bli 0	Blinking Duty	0	0	Blink Off	0	1	Duty 25%	1	0	Duty 50%	1	1	Duty 75%

	0	0	Blink Off														
	0	1	Duty 25%														
	1	0	Duty 50%														
	1	1	Duty 75%														
	ScrT (Bit 3)	Scroll Time Control. If this bit is high, the scroll time is 0.5 sec. Otherwise, 1 sec.															
	Scrl (Bit 4)	Scroll Enable. The scroll display is activated by setting this bit high.															
	EN (Bit 5)	OSD Enable. If this bit is high, OSD is enable. Otherwise, disable.															
	Erase (Bit 6)	RAM Erasing. RAM data are erased by setting this bit.															
Bit A ~ 7	Reserved.																
HPOL (Bit B)	Polarity of Horizontal Fly Back Signal. Positive 1, Negative 0																
VPOL (Bit C)	Polarity of Vertical Fly Back Signal. Positive 1, Negative 0																
FdeT (Bit D)	Fade-in and fade-out Time Control. If this bit is high, the time is 0.5 sec. Otherwise, 1 sec.																
Fde (Bit E)	Fade-in and fade-out Enable. The fade-in and fade-out effect is activated by setting this bit high.																
Bit F	Reserved.																

Table 4. Register Description (Continued)

Registers	Bits	Description																																			
Frame Control Register 1 (Row 15, Column 01)	CH 5~CH 0 (Bit 5~0)	Character Height Control. The vertical character size is determined by the bit 'VZ1' and VZ0'. According to the value made by this six bits, the character height is determined. If the value is 32, the number of vertical pixel of character font is 32. Eventually, the character height is expanded from 18 to 63. The binary vlaue must be greater than 18.																																			
	FBLK (Bit 6)	It determines the configuration of FBLK output pin. When it is clear, FBLK pin outputs high during displaying characters or rasters. Otherwise,FBLK pin outputs high only during displaying characters.																																			
	dot 1,dot 0 (Bit 9,8)	This two bits determine the number of dots per horizontal line. <table border="1" data-bbox="635 891 1321 1131"> <thead> <tr> <th>dot 1</th> <th>dot 0</th> <th>No. of Dots</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>320 dots/line</td> </tr> <tr> <td>0</td> <td>1</td> <td>480 dots/line</td> </tr> <tr> <td>1</td> <td>0</td> <td>640 dots/line</td> </tr> <tr> <td>1</td> <td>1</td> <td>800 dots/line</td> </tr> </tbody> </table>	dot 1	dot 0	No. of Dots	0	0	320 dots/line	0	1	480 dots/line	1	0	640 dots/line	1	1	800 dots/line
