

Monolithic Linear IC

SANYO	No.4468A	LA4590W
	1.5 V Stereo Headphone Preamp and Power Amplifier	

Overview

The LA4590W is a system IC that collects the functions required for a playback set in a single chip, and reduces the number of required external components. Furthermore, a recording system can be formed by combining the LA4590W with the LA3235W.

Functions

- Stereo preamplifier (including functions for auto-reverse, metal/normal tape switching, and muting)
- Stereo power amplifier (including OCL and muting functions)
- Two ripple filters (single channel on/off switching)
- Low boost (BTL operation at low frequencies)
- AMS (inter-station detection function)
- Power switch

Features

- Preamplifier requires no NF capacitors.
- Virtual ground impedance is reduced by built-in V_{REF} amplifier.
- Ripple filter oscillation suppression requires no capacitors.
- Power output available when low boost is on. ($P_o = 21 \text{ mW}/V_{CC} = 1.2 \text{ V}$, $f = 100 \text{ Hz}$)
- High-cut capacitors built into preamplifier and power amplifier. Buzz suppression
- Miniature package: SQFP-48 (0.5 mm pitch)

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC \text{ max}}$		3.0	V
Allowable power dissipation	$P_d \text{ max}$		320	mW
Operating temperature	T_{opr}		-10 to +60	$^\circ\text{C}$
Storage temperature	T_{stg}		-40 to +125	$^\circ\text{C}$

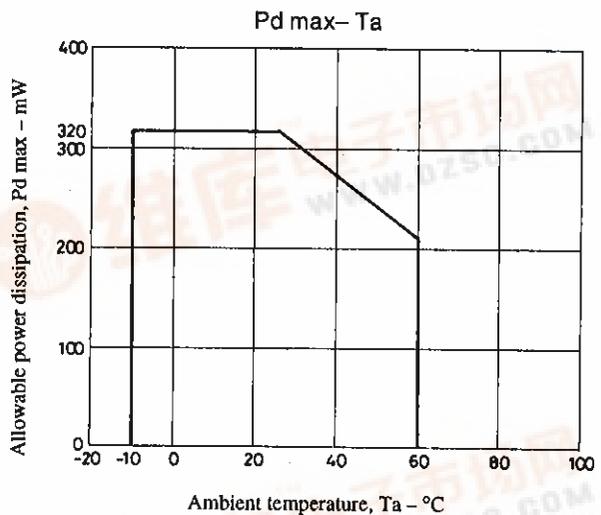

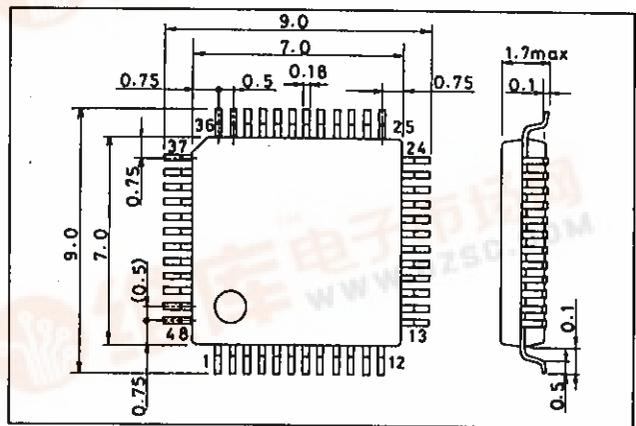

Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	V_{CC}		1.5	V
Operating supply voltage range	$V_{CC \text{ op}}$		0.95 to 2.2	V

Package Dimensions

unit: mm

External Component Functions: Recommended values are indicated in parentheses.

- C_1 (1.0 to 10 μF)

V_{REF} amplifier reference decoupling capacitor

This capacitor changes the V_{REF} SVRR. Note that the SVRR is degraded as this capacitance decreases.

- C_2, C_{10}

Playback equalization constants

- C_3, C_9 (0.47 to 3.3 μF)

Preamplifier output capacitors

- C_4, C_8

AMS input high-pass filter capacitors

- C_5, C_7

Metal tape equalization constants. (The internal resistance is $3.9 \text{ k}\Omega \pm 15\%$.)

- C_6 (0.1 to 22 μF)

V_{REF} decoupling capacitor

Used for excluding high-frequency noise.

- C_{11}, C_{12} (3.3 to 10 μF)

NFC decoupling capacitors

Note that the preamplifier low-frequency gain falls as these capacitances are reduced.

- C_{13}, C_{15} (1.0 to 3.3 μF)

Power amplifier input capacitors (Input resistance: 10 $\text{k}\Omega$)

- C_{14}, C_{17}

Low boost low-pass filter capacitors

The low boost gain can be changed by varying these capacitances.

- C_{16} (1.0 to 4.7 μF)

Boost amplifier NF capacitor

Note that the low boost low-frequency gain falls as these capacitances are reduced.

- C_{18}, C_{23}, C_{26} (0.1 to 1.0 μF)

Oscillation suppression capacitors

- C_{19}, C_{22}, C_{25} (3.3 to 10 μF)

Power amplifier NF capacitors

Note that the power amplifier low-frequency gain falls as these capacitances are reduced.

- C_{20}, C_{24}

Loudness high boost capacitors

The high-frequency gain is changed by these capacitances.

- C_{21} (100 to 2200 pF)

Oscillation suppression capacitor

- C_{27}, C_{29} (4.7 to 10 μF)

R.F. output decoupling capacitors (These capacitors also function as power supply capacitors and oscillation suppression capacitors.)

- C_{28} (22 to 220 μF)

Power supply capacitors

LA4590W

- C_{30} (2.2 to 10 μF)

R.F. reference low-pass filter capacitor

The R.F. SVRR is changed by this capacitance.

- C_{31}, C_{32} (6800 pF to 0.22 μF)

Switching circuit smoothing capacitors. These capacitances must be adjusted according to the set timing.

- C_{33}, C_{34} (470 to 1000 pF)

Oscillation suppression capacitors used when both the preamplifier and power amplifier are used, i.e., when the volume is maximum.

- R_1, R_{10}

Preamplifier gain adjustment

- R_2, R_9

Playback equalization constants

- R_3, R_8

Metal tape equalization constants

- R_4, R_7

10 k Ω variable resistors

- R_5, R_6

AMS gain adjustment and high pass filter

- R_{11}, R_{12}, R_{13}

Oscillation suppression

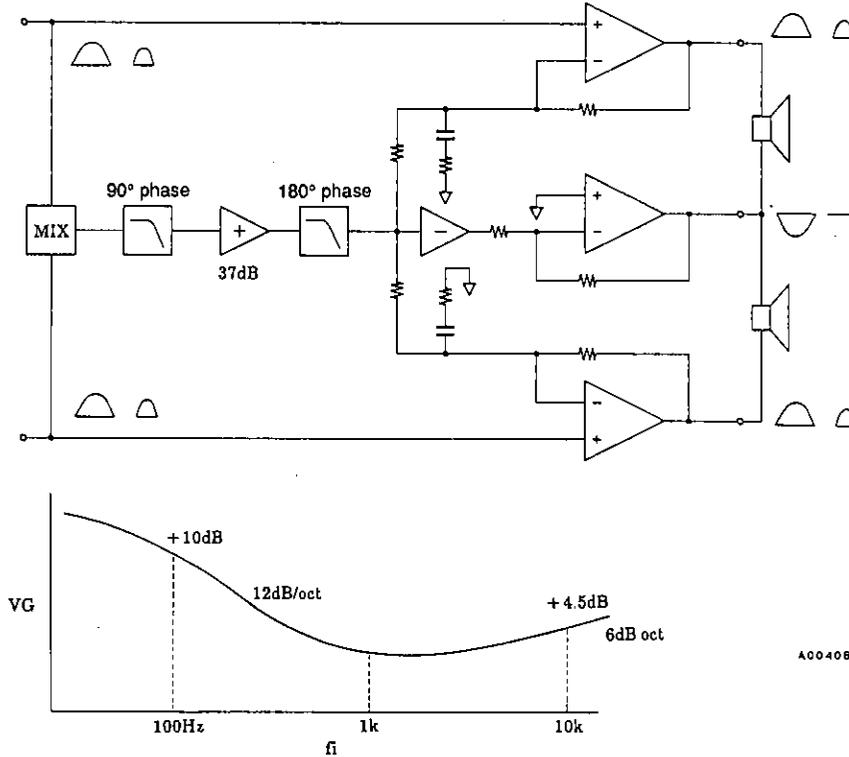

- R_{14}, R_{15} (100 to 430 k Ω)

Switching circuit smoothing (discharge resistors)

Function Descriptions

1. Low boost system

This system amplifies low frequencies at 12 dB per octave, and high frequencies at 6 dB per octave.

2. Low boost

The signals applied to each input are mixed and passed through a two-stage low-pass filter. Since the signal level is reduced by the low-pass filters it is amplified between the two low-pass filter stages to correct the level. The signal that has passed through the second low-pass filter is reversed in phase with respect to the input signal and is input to each power amplifier.

3. Channels 1 and 2 amplifiers

The positive-phase input signals are input to the normal (+) inputs, and the reverse-phase signal that was passed through the low-pass filter is input to the inverting (-) inputs.

4. Common amplifier

The signal that has passed through the low-pass filter is phase inverted by an inverting amplifier and input to the common amplifier's inverting (-) input. Note that this input signal is reverse phase from the signal input to the channel 1 and channel 2 amplifier inverting (-) inputs. Since the amplifier's plus input is connected to Vref, it functions as an inverting amplifier.

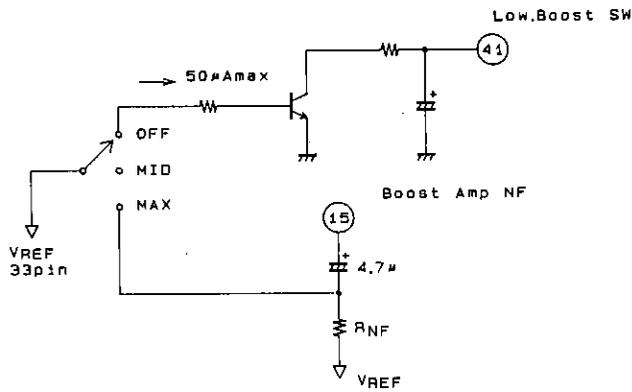

This circuit achieves a large dynamic range since the common amplifier and the channel 1 and channel 2 amplifiers operate in reverse phases.

LA4590W

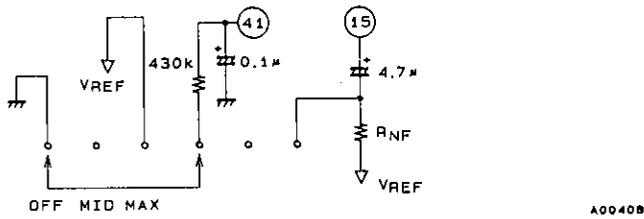

Low Boost Switching Application Circuit Proposals

Unit (Resistance: Ω, Capacitance: F)

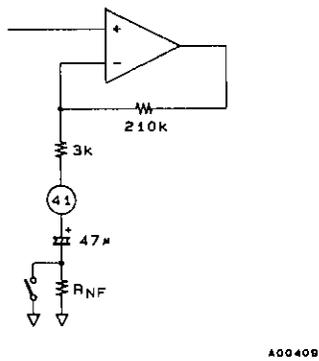

Proposal 1

Proposal 2

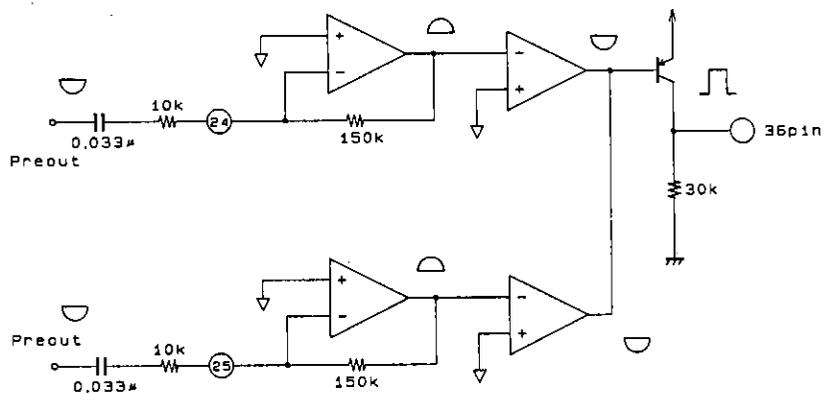

The above circuits both achieve middle and maximum settings by changing the boost amplifier gain.

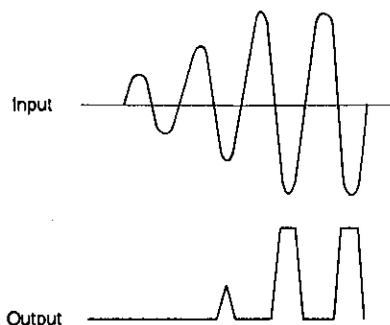

AMS Comparator

Block Diagram

Function Descriptions

1. The input amplifier has an inverting structure. The gain and the high pass filter characteristics are adjusted by an external CR circuit that determines the input impedance.
2. The AMS comparator outputs pulses for input waveforms that fulfill certain conditions (frequency and voltage level).

3. Connect pins 24 and 25 to Vref (pin 33) if the AMS function is not used.

Ripple Filter

1. The ripple filter SVRR is adjusted with the external capacitor connected at pin 44.

3.3 μF \rightarrow 39 dB

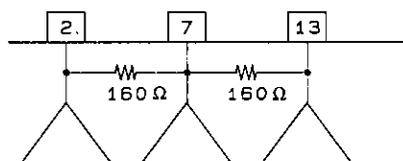

4.7 μF \rightarrow 42 dB

10 μF \rightarrow 47 dB

2. Leave pins 43, 48 and 1 floating if ripple filter 1 is not used.
3. We recommend using a 2SB1295 of rank 6 or higher as the external transistor.

Power Output

1. The power amplifier and common amplifier outputs are connected by resistances of about 160 Ω .

A00411

Power Muting

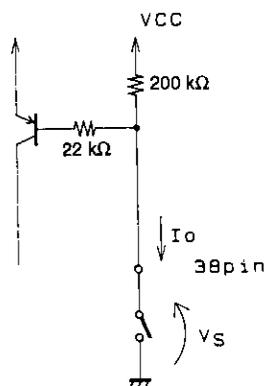

1. The power muting function turns off the fixed current supplied to the power block.
2. The output DC voltage when the power muting function is on is the Vref potential (0.75 V).
3. The output impedance when the power muting function is on is about 10 k Ω .

Preampifier Muting

1. The preampifier muting function turns off the fixed current supplied to the preampifier block.
2. The output DC voltage when the preampifier muting function is on is the Vref potential (0.75 V).
3. The output impedance when the preampifier muting function is on is determined by the NAB constants.

Switch Pin Equivalent Circuits

1. Power switch pin

The power switch is on when the power switch pin is connected to ground.

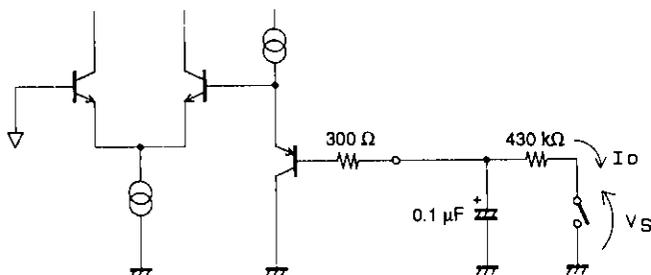

$$I_o = V_{CC}/200\text{ k} + V_{CC} - 0.7\text{ V}/22\text{ k}\Omega$$

Pin 38

$$V_S \leq 100\text{ mV}$$

A00412

2. Power muting and low boost switch pins

The power muting function is turned on when pin 37 is connected to ground.

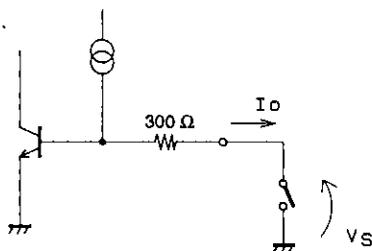

The low boost switch is turned on when pin 41 is floating.

$$I_o \leq 0.1\ \mu\text{A}$$

$$V_S \leq 80\text{ mV}$$

Note: The smoothing discharge resistor should be 430 kΩ or smaller.

3. FWD/REV, METAL, PRE-MUTE, R.F1 switches

Reverse is selected when pin 39 is connected to ground.

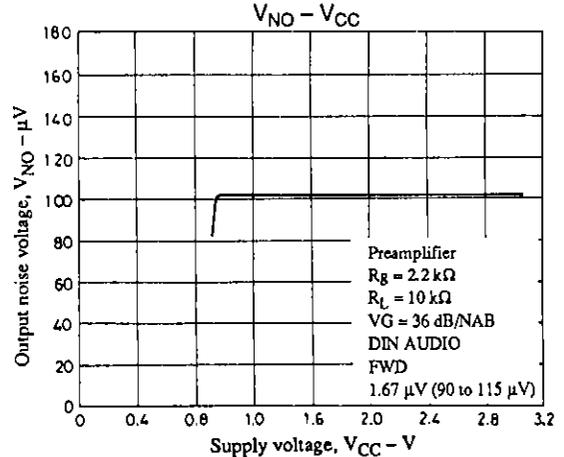

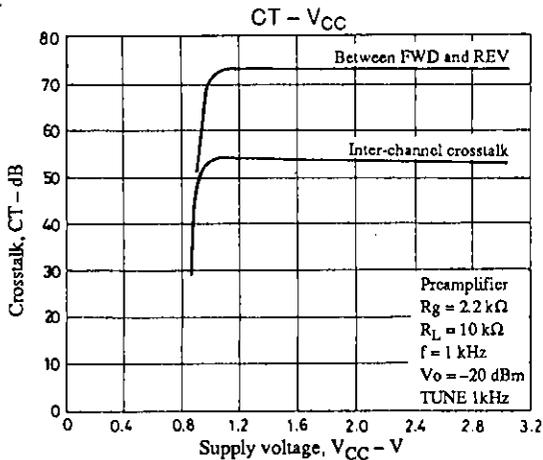

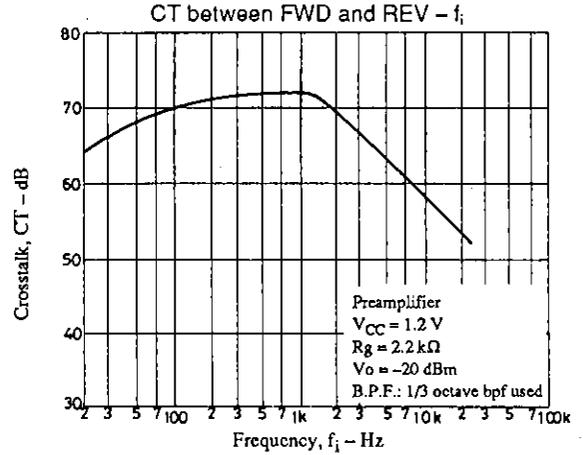

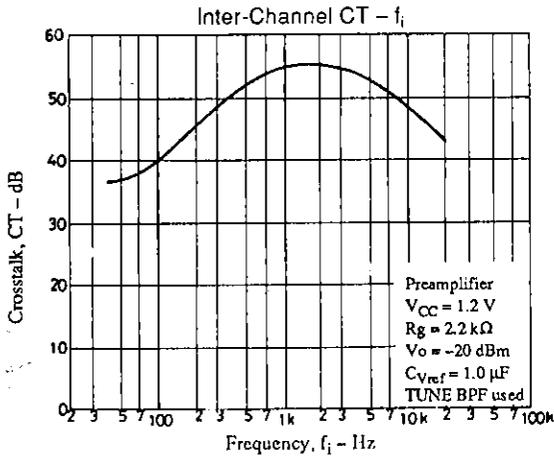

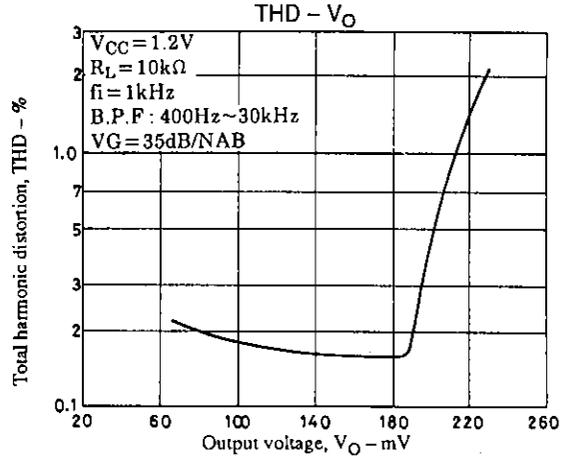

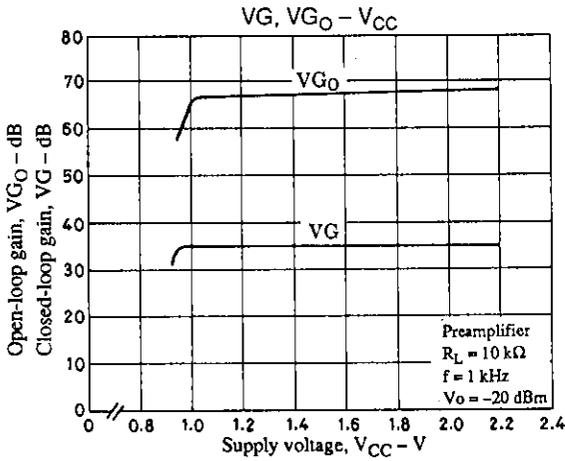

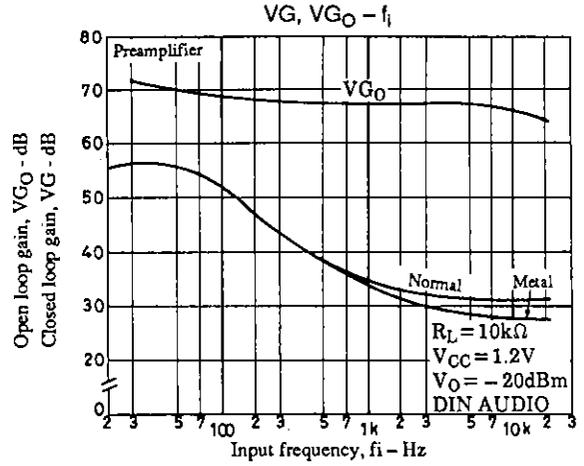

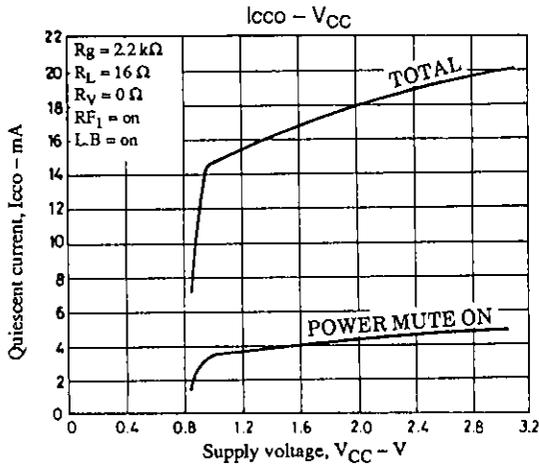

Metal tape is selected when pin 40 is floating.

Pre-amplifier muting is turned on when pin 42 is floating.

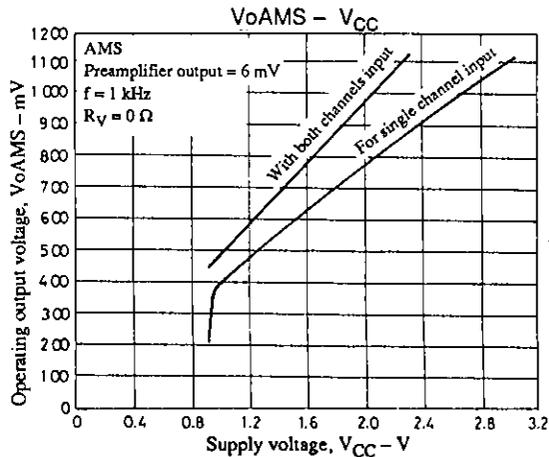

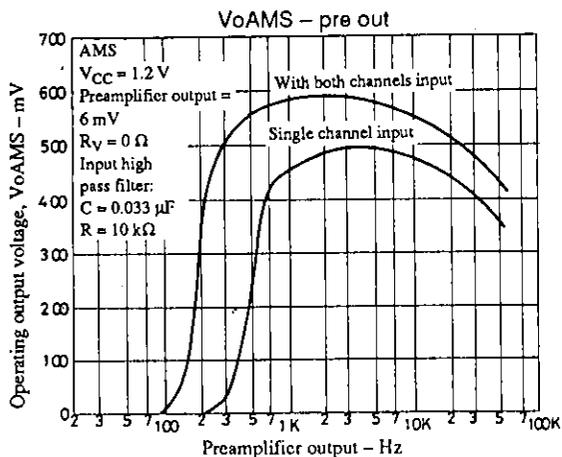

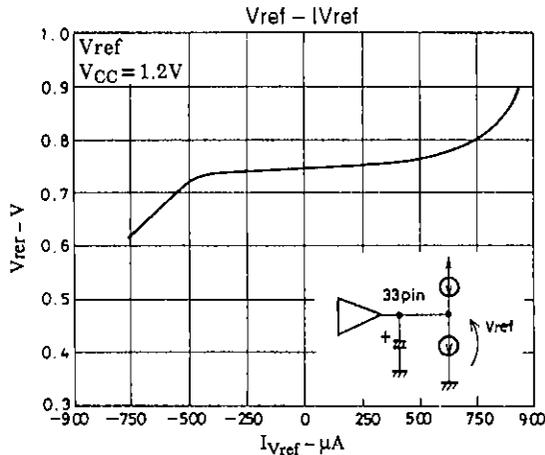

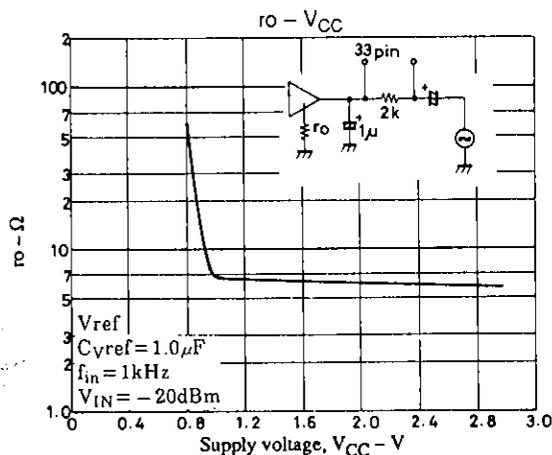

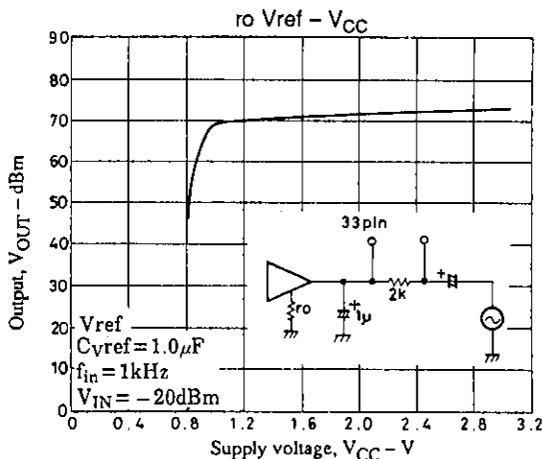

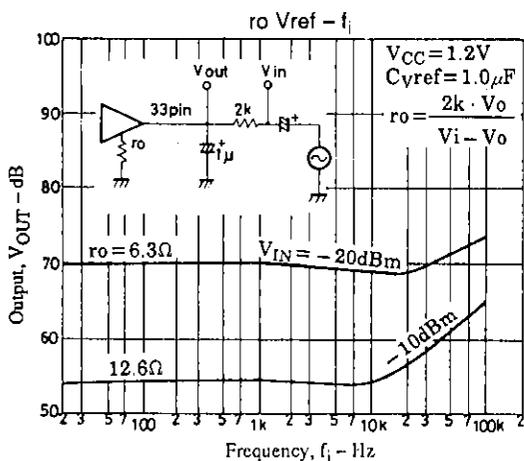

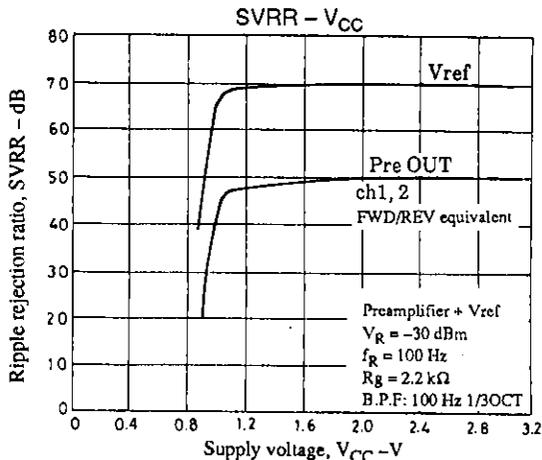

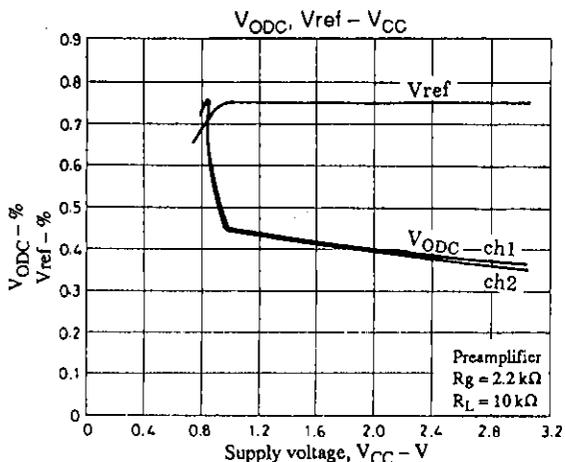

The ripple filter switch is turned on when pin 43 is grounded.

$$\left\{ \begin{array}{l} \text{Pins 39, 40, and 43} \\ I_o \leq 7\ \mu\text{A} \\ V_S \leq 0.5\text{ V} \end{array} \right. \quad \left\{ \begin{array}{l} \text{Pin 42} \\ I_o \leq 14\ \mu\text{A} \\ V_S \leq 0.5\text{ V} \end{array} \right.$$
