

## Overview

The LA5602 incorporates both a 5.0V voltage regulator function and reset generator function into a single-chip for micro controller power supply application. The LA5602 supports improvements in efficiency and set compactness by permitting operation at low input-output voltage differences.

## Functions

- Low dropout regulator with 350mA and 5.0V output
- Power supply reset generator function
- Supports on-off control of 5V using equipped enable pin (high active)

## Features

- Low minimal input-output voltage difference (0.5V typ.)
- Supports setting of reset output delay time using external capacitor
- Built-in fold back current limiting circuit and excessive heat protection circuit
- Reset output using active pull-up for simpler noise reduction

- Notes:
- 1) Capacitors  $C_n$  and  $C_{RES}$  are only required if problems are experienced with noise from external sources. If capacitor  $C_n$  is present, ensure that  $C_o$  is at least more than one-third of the value of  $C_{in}$  in order to prevent output noise at power-down due to capacitor discharge timing.
  - 2) Use a low temperature coefficient capacitor for the delay time capacitor  $C_d$ .
  - 3) The minimum recommended value of output capacitor  $C_o$  is  $47\mu\text{F}$ .

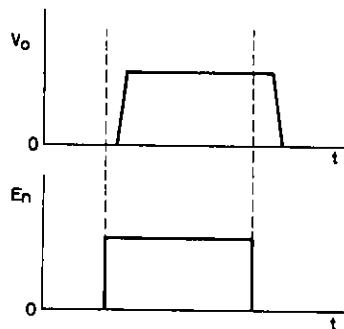

$$t_d = 100 \times C_d (\mu\text{F}) [\text{mS}]$$
