		Monolithic Linear IC Color TV Synchronization, Deflection Circuit

The LA7822 is an IC containing not only the main functions required to achieve synchronization and deflection in color television receivers but also a generator of horizontal, vertical blanking pulses. It is a multifunctional IC ideally suited for use in color television receivers aiming at high-quality picture reproduction.

Functions

- Synchronizing separation
- Horizontal AFC
- Composite blanking pulse (vertical + horizontal blanking pulse)
- Vertical blanking pulse (Only vertical blanking pulse can be taken out.)
- Vertical oscillation
- Horizontal oscillation
- Vertical drive
- X-ray protection

Features

- Horizontal and vertical oscillations are stable against variations in ambient temperature and supply voltage due to small warm-up drift.
- Small variation in horizontal oscillation frequency.
- Good linearity and interlace because DC bias at vertical output stage is subjected to sampling control within retrace time.
- Vertical blanking pulse width can be set freely by peripheral parts.
- Minimized picture distortion because AFC circuit is defeated during vertical trigger pulse input period.
- Multifunctional and compact (DIP-16).
