## On-Screen Display Controller LSI

### Overview

The LC74725 and LC74725M are built-in EDS on-screen display controller CMOS LSI products that display characters and patterns on a TV screen under microprocessor control. The characters displayed have an 8 × 8 dot format, and a dot interpolation function is provided. These LSIs can display ten lines of 24 characters each.

### Features

- Display format: 24 characters by 10 lines (up to 240 characters)
- Character format: 8 (horizontal) × 8 (vertical) dots (interpolation function provided)
- Character sizes: Two horizontal and two vertical sizes
- Characters in font: 64 characters
- Initial display positions: 64 horizontal positions and 64 vertical positions
- Blinking: Specifiable on a per-character basis
- Blinking types: Two periods, 1.0 second and 0.5 second
- Blue background screen display: Available in internal synchronization mode
- External control input: 8-bit serial input format
- Built-in sync separator circuit
- EDS support
- Video outputs: Composite video signal output in either NTSC or PAL-M
- Package: 24-pin plastic DIP (300 mil)  
24-pin plastic MFP (375 mil)

### Pin Functions

Pin No.	Symbol	Function	Description
1	V <sub>SS1</sub>	Ground	Ground connection (digital system ground)
2	Xtal <sub>IN</sub>	Crystal oscillator	Connections for the external crystal and capacitors used to form a crystal oscillator for internal synchronizing signal generation. Alternatively, these pins can be used for external clock input (2fsc or 4fsc).
3	Xtal <sub>OUT</sub>		
4	CTRL1	Crystal oscillator input switching	Switches between external clock input mode and crystal oscillator mode. Low: crystal oscillator mode, high: external clock input mode.
5	LN21	Data output	Line 21H pulse output (MOD0 = low: even field, MOD0 = high: both fields output)
6	OSC <sub>IN</sub>	LC oscillator	Connections for the external coil and capacitor used to form the character output dot clock generation oscillator.
7	OSC <sub>OUT</sub>		
8	SYNC <sub>JDG</sub>	External synchronizing signal judgment output	Outputs the judgment as to where there are or are not external synchronizing signals present. Outputs a high level when there are synchronizing signals. SELO = high: Outputs field discrimination pulses (O/E pulses) Outputs the dot clock (LC oscillator) when the $\overline{CS1}$ pin is high and the $\overline{RST}$ pin is low. A command is provided that turns this output off. Outputs the crystal oscillator clock when the $\overline{CS1}$ pin is low and the $\overline{RST}$ pin is low. A command is provided that turns this output off.
9	$\overline{CS1}$	Enable input	Enable input for OSD serial data input. Serial data input is enabled when this pin is low. A pull-up resistor is built in (hysteresis input).
10	SCLK	Clock input	Serial data input clock input. A pull-up resistor is built in (hysteresis input).
11	SIN	Data input	Serial data input. A pull-up resistor is built in (hysteresis input).
12	V <sub>DD2</sub>	Power supply	Composite video signal level adjustment power supply (analog system power supply)
13	CV <sub>OUT</sub>	Video signal output	Composite video signal output pin
14	NC		Must be either connected to ground or left open.
15	CV <sub>IN</sub>	Video signal input	Composite video signal input pin
16	V <sub>DD1</sub>	Power supply	Power supply (+5 V: digital system power supply)
17	SYN <sub>IN</sub>	Sync separator circuit input	Video signal input to the built-in sync separator circuit
18	V <sub>SS1</sub>	Ground	Ground (digital system ground)
19	SEP <sub>OUT</sub>	Composite synchronizing signal output	Video signal output from the built-in sync separator circuit
20	SEP <sub>IN</sub>	Vertical synchronizing signal input	Inputs the vertical synchronizing signal generated by integrating the SEP <sub>OUT</sub> pin output signal. An integrating circuit must be inserted between the SEP <sub>OUT</sub> pin and this pin. This pin must be tied to V <sub>DD1</sub> if unused.
21	$\overline{CS2}$	Enable input	Enable input for EDS data output. EDS data output is enabled when this input is low. A pull-up resistor is built in (hysteresis input).
22	CP <sub>DT</sub>	Data output	EDS data output (either an n-channel open-drain or a CMOS output circuit)
23	$\overline{RST}$	Reset input	System reset input. A pull-up resistor is built in (hysteresis input).
24	V <sub>DD1</sub>	Power supply (+5 V)	Power supply (+5 V: digital system power supply)

Note: Both V<sub>DD1</sub> pins must be connected to the power supply.

Note: The  $\overline{O/E}$  signal is output from the  $\overline{SYNC}_{J DG}$  pin when  $SELO$  is high.  
 LN21 outputs the even field when  $MOD0$  is low, and both fields when  $MOD0$  is high.

## LC74725, 74725M

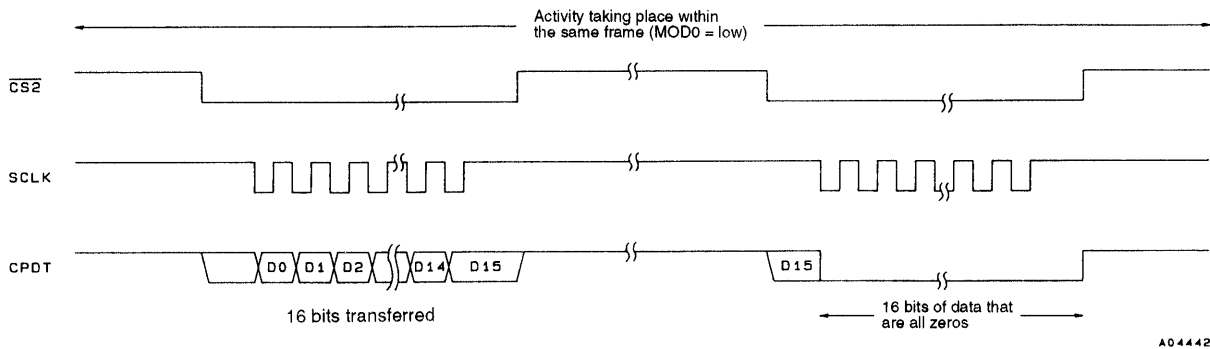

A04441

Note: When closed caption character data is extracted in NTSC-TV mode (MOD0 is high), the control microprocessor can determine whether the current field is an odd field or an even field by checking the signal level output by the SYNC<sub>JDG</sub> pin (when SEL0 is high) at the point it detects the rise of the LN21 signal.

**Figure 4 LC74725/M to Decoder LSI (or Microprocessor) Caption Data Transfer Technique 1  
(This is the basic usage mode for these LSIs.)**

Caption data transfer to the data output buffer is synchronized with the falling edge of the pulse output from LN21. Therefore, the following software processing is required if the decoder LSI (or microprocessor) does not detect the fall of LN21.

A04442

When MOD0 is low, since the data is output to the data buffer once (during the even field) in a single frame, the decoder LSI (or microprocessor) must perform the transfer control operation at least twice per frame (about 32 ms).

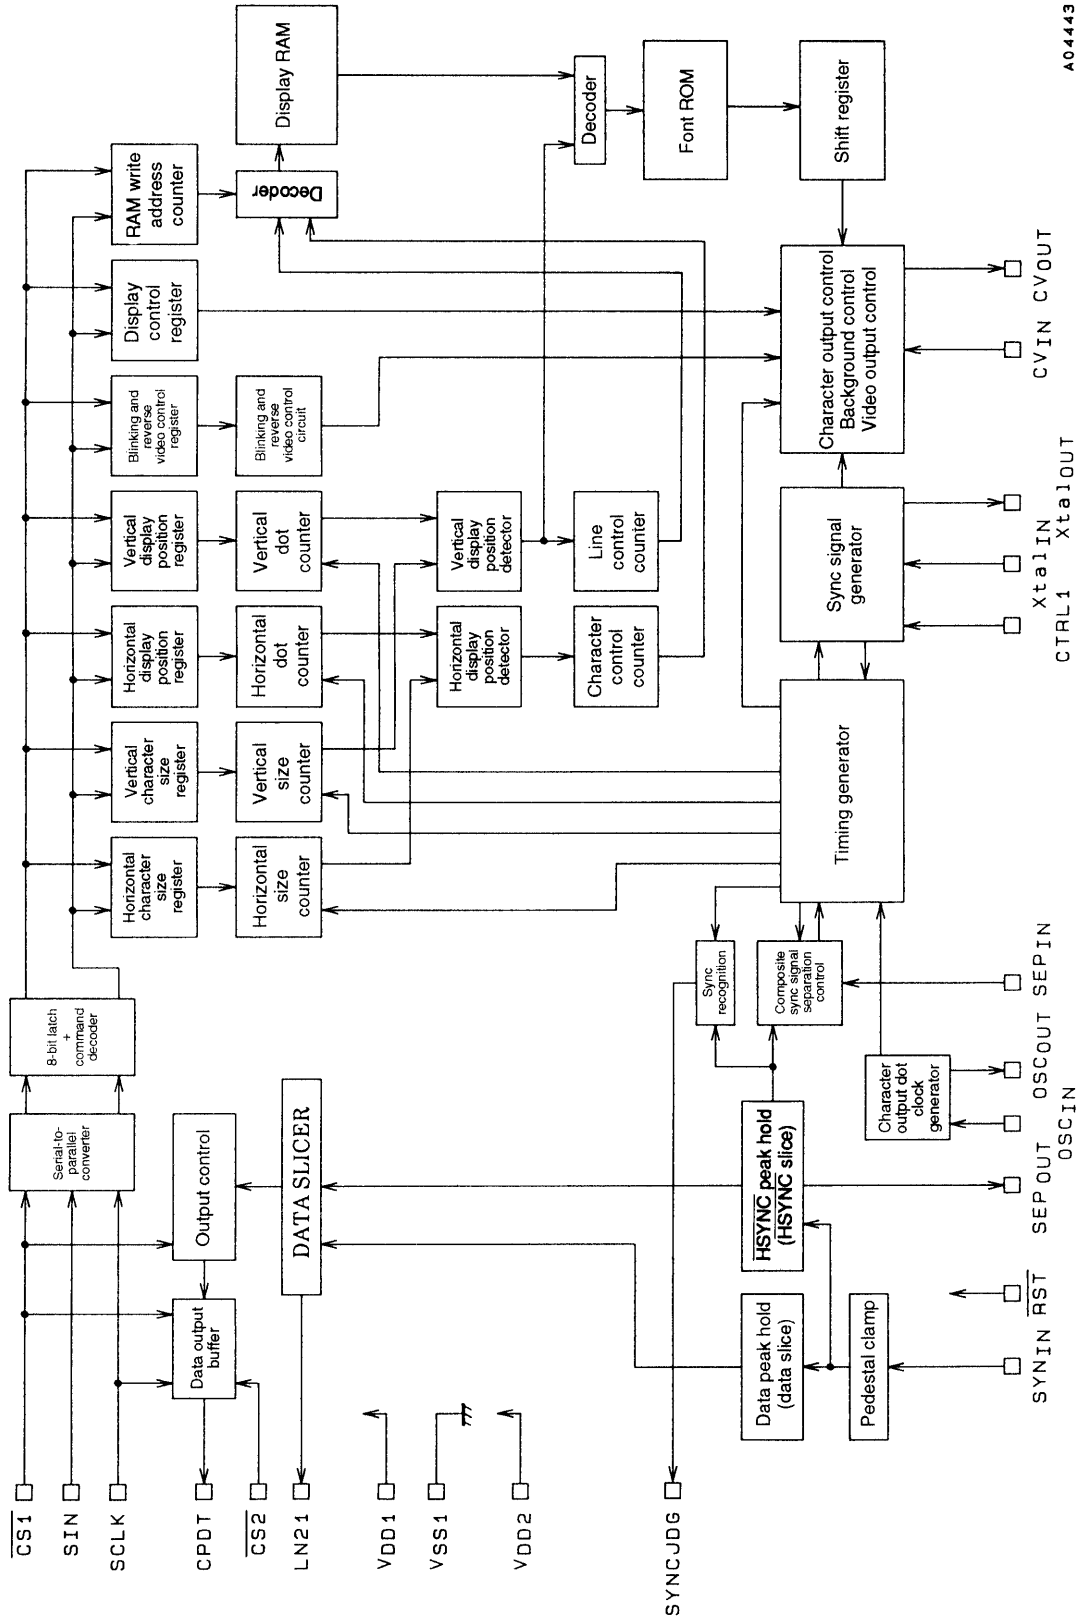

When the transfer control operation is performed twice in the same frame, the second CPDT 16 bits of output data are all zeros. Therefore, the microprocessor must determine that the data for the next frame had not been transferred to the output buffer in this case.

Note: The LC74725 hardware will not transfer data to the output buffer while  $\overline{CS2}$  is low. Therefore the decoder LSI (or microprocessor) must restore  $\overline{CS2}$  from the low level to the high level after completing a data transfer control cycle.

This transfer technique (technique 2) cannot be used in NTSC-TV mode, i.e., when MOD0 is high.

**Figure 5 LC74725/M to Decoder LSI (or Microprocessor) Caption Data Transfer Technique 2  
(When a port to detect the fall of LN21 cannot be allocated in the decoder LSI (or Microprocessor).)**

### Display Control Commands

Display control commands have an 8-bit format and are transferred using the serial input function. Commands consist of a command identification code in the first byte and command data in the following bytes. The following commands are supported.

- ① COMMAND0: Display memory (VRAM) write address setup command
- ② COMMAND1: Display character data write command
- ③ COMMAND2: Vertical display start position and vertical character size setup command
- ④ COMMAND3: Horizontal display start position and horizontal character size setup command
- ⑤ COMMAND4: Display control setup command
- ⑥ COMMAND5: Display control setup command

### Display Control Command Table

Command	First byte								Second byte							
	Command identification code				Data				Data							
	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
COMMAND0 Set write address	1	0	0	0	V3	V2	V1	V0	0	0	0	H4	H3	H2	H1	H0
COMMAND1 Write character	1	0	0	1	0	0	0	0	at	0	c5	c4	c3	c2	c1	c0
COMMAND2 Set vertical display start position and vertical character size	1	0	1	0	0	VS 20	0	VS 10	0	FS	VP 5	VP 4	VP 3	VP 2	VP 1	VP 0
COMMAND3 Set horizontal display start position and horizontal character size	1	0	1	1	EGP	HS 20	0	HS 10	0	LC	HP 5	HP 4	HP 3	HP 2	HP 1	HP 0
COMMAND4 Display control	1	1	0	0	TST MOD	RAM ERS	OSC STP	SYS RST	0	EGL	NON	EG	BK 1	BK 0	RV	DSP ON
COMMAND5 Synchronizing signal control	1	1	0	1	BCL	PH	RSN	INT	0	0	0	MUT	MOD 0	CTL 3	CTL 2	SEL 0

Once written, the command identification code in the first byte is stored until the next first byte is written. However, when the display character data write command (COMMAND1) is written, the LC74725/M locks into the display character data write mode, and another first byte cannot be written.

When a high level is input to the  $\overline{CS}$  pin, the LC74725/M is set to COMMAND0 (display memory write address setup mode).

3	BCL	0	Background color present	Only valid in internal synchronization mode
		1	No background color (only the background level is set)	
2	PH	0	Green background	Background color switching (Only valid in NTSC mode) (In PAL-M mode, only blue is available as the background color.)
		1	Blue background	
1	RSN	0	External synchronizing signal detection control: Off	External synchronizing signal detection control. Determines when the signal goes from detected to undetected, and from undetected to detected.
		1	External synchronizing signal detection control: On	
0	INT	0	External synchronization	Switches between external and internal synchronization
		1	Internal synchronization	

#### Second byte

DA0 to DA7	Register name	Register content		Note
		State	Function	
7	—	0	Second byte identification bit	
6	—	0		
5	—	0		
4	MUT	0	Normal output	Switches CV <sub>OUT</sub> .
		1	CV <sub>IN</sub> is cut and CV <sub>OUT</sub> is fixed at the pedestal level.	
3	MOD0	0	Even field line 21 data extraction (VCR)	Switches line 21 data extraction operation.
		1	Both even and odd field line 21 data extraction (NTSC-TV)	
2	CTL3	0	Internal V separation used.	Switches V separation usage.
		1	Internal V separation not used.	
1	CTL2	0	NTSC	Switches between generation of NTSC and PAL-M signals.
		1	PAL-M	
0	SEL0	0	External synchronizing signal detection output signal	Switches SYNC <sub>JDG</sub> (pin 21) output.
		1	O $\bar{E}$ signal	

Note: The register states are all set to zero when the LC74725/M is reset with the  $\overline{RST}$  pin.

### Composite Video Signal Output Level (internally generated level)

A04446

**CV<sub>OUT</sub> Output Level Waveform ( $V_{DD2} = 5.00\text{ V}$ )**

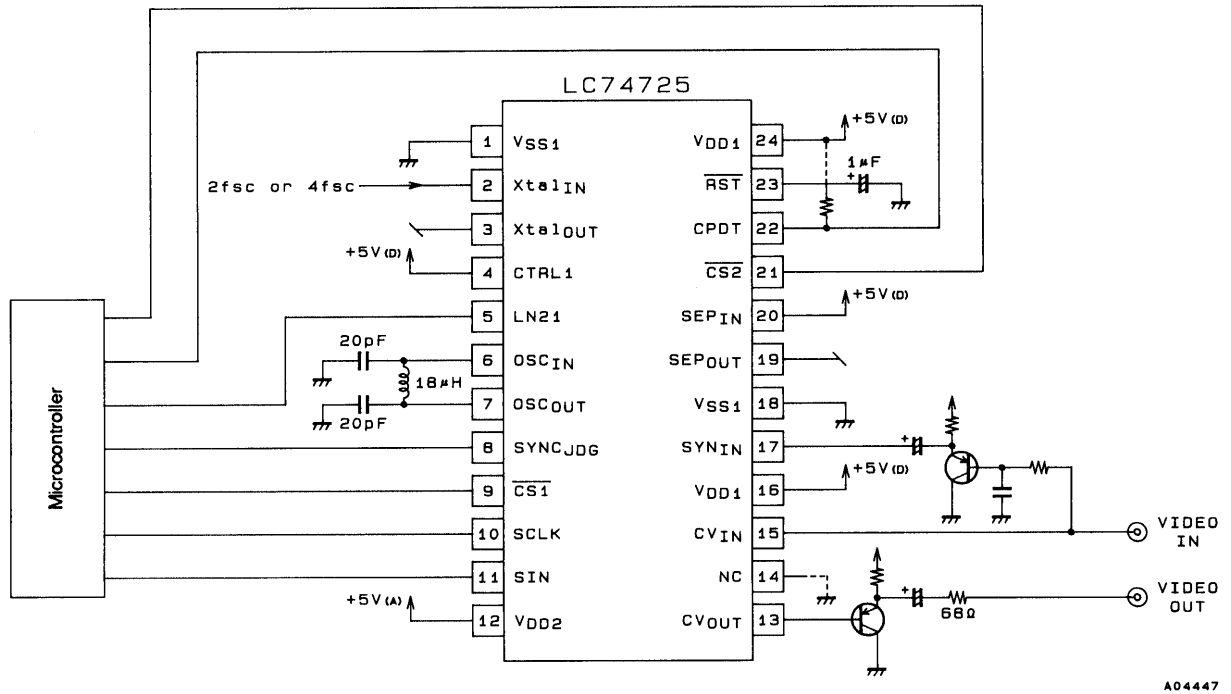

Output level	Output voltage ① [V]	Output voltage ② [V]
$V_{CHA}$ : Character	2.69	2.88
$V_{RSH}$ : Background color high	2.08	2.28
$V_{CBH}$ : Color burst high	1.72	1.91
$V_{RSL}$ : Background color low	1.56	1.75
$V_{BK1}$ : Border	2.13	2.30
$V_{BK0}$ : Border	1.55	1.73
$V_{PD}$ : Pedestal	1.40	1.59
$V_{CBL}$ : Color burst low	1.09	1.28
$V_{SN}$ : Sync	0.81	1.01

$V_{DD2} = 5.00\text{ V}$
