DESCRIPTION

The LM318 is a high speed, unity gain stable operational amplifier designed for applications requiring high slew rate and wide bandwidth. Although the device is internally compensated for unity gain operation, external compensation can be added for increased stability in reduced bandwidth applications. With a single capacitor, the 0.1% settling time is reduced to under 1μs. Feedforward compensation can be used in inverting applications to increase slew rate to over 150V/μs and almost double the bandwidth.

The ● denotes those specifications which apply over the full operating temperature range.

Note 1: The inputs are shunted with back-to-back zeners for overvoltage protection. Excessive current will flow if a differential voltage greater than 5V is applied to the inputs.

Note 2: For supply voltages less than $\pm 15V$, the maximum input voltage is equal to the supply voltage.

Note 3: These specifications apply for $\pm 5V \leq V_S \leq \pm 20V$. The power supplies must be bypassed with a 0.1 μF or greater disc capacitor within 4 inches of the device.
