

LNBH21

LNB SUPPLY AND CONTROL IC WITH STEP-UP CONVERTER AND I²C INTERFACE

- COMPLETE INTERFACE BETWEEN LNB AND I²C™ BUS
- BUILT-IN DC/DC CONTROLLER FOR SINGLE 12V SUPPLY OPERATION AND HIGH EFFICIENCY (Typ. 94% @ 750mA)
- TWO SELECTABLE OUTPUT CURRENT LIMIT (450mA / 750mA)
- BOTH COMPLIANT WITH EUTELSAT AND DIRECT OUTPUT VOLTAGE SPECIFICATION
- ACCURATE BUILT-IN 22KHz TONE OSCILLATOR SUITS WIDELY ACCEPTED STANDARDS
- FAST OSCILLATOR START-UP FACILITATES DiSEqC™ ENCODING
- BUILT-IN 22KHz TONE DETECTOR SUPPORTS BI-DIRECTIONAL DiSEqC™2.0
- SEMI-LOWDROP POST REGULATOR AND HIGH EFFICIENCY STEP-UP PWM FOR LOW POWER LOSS: Typ. 0.56W @ 125mA
- TWO OUTPUT PINS SUITABLE TO BYPASS THE OUTPUT R-L FILTER AND AVOID ANY TONE DISTORSION (R-L FILTER AS PER DiSEqC 2.0 SPECS, see application circuit on pag. 5)
- CABLE LENGTH DIGITAL COMPENSATION
- OVERLOAD AND OVER-TEMPERATURE INTERNAL PROTECTIONS

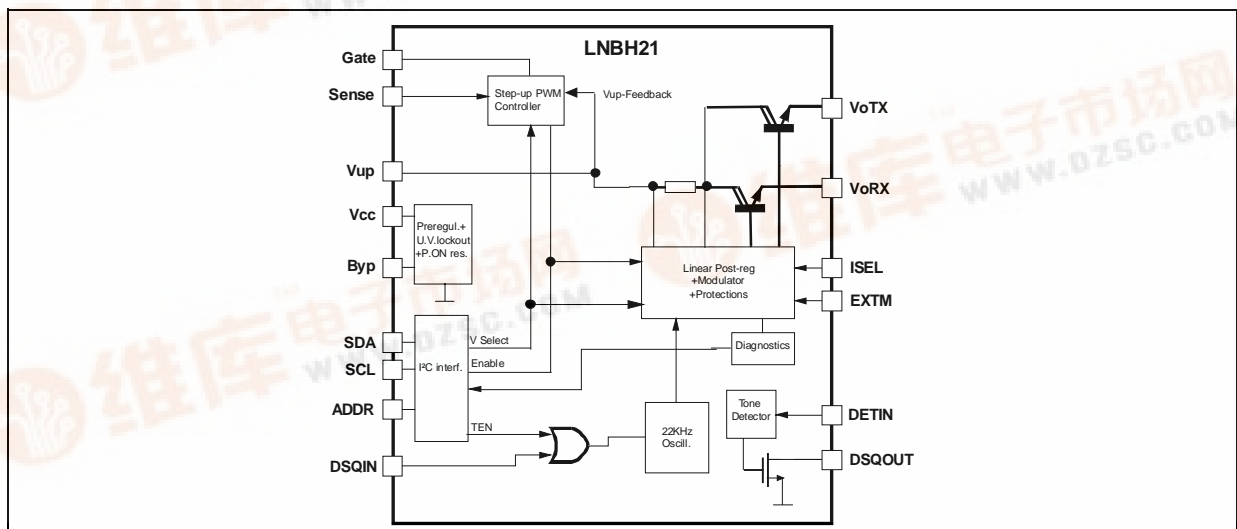

- OVERLOAD AND OVER-TEMPERATURE I²C DIAGNOSTIC BITS
- LNB SHORT CIRCUIT SOA PROTECTION WITH I²C DIAGNOSTIC BIT
- +/- 4KV ESD TOLERANT ON INPUT/ OUTPUT POWER PINS

DESCRIPTION

Intended for analog and digital satellite STB receivers/SatTV, sets/PC cards, the LNBH21 is a monolithic voltage regulator and interface IC, assembled in POWER SO-20, specifically designed to provide the 13/18V power supply and the 22KHz tone signalling to the LNB downconverter in the antenna or to the multiswitch box. In this application field, it offers a complete solution with extremely low component count, low power dissipation together with simple design and I²C™ standard interfacing.

PIN CONFIGURATION (top view)

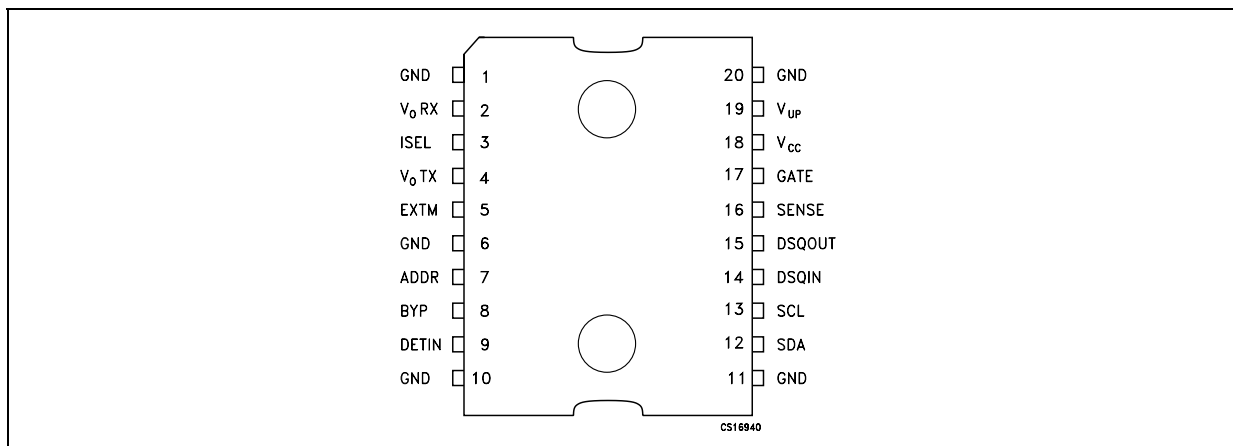

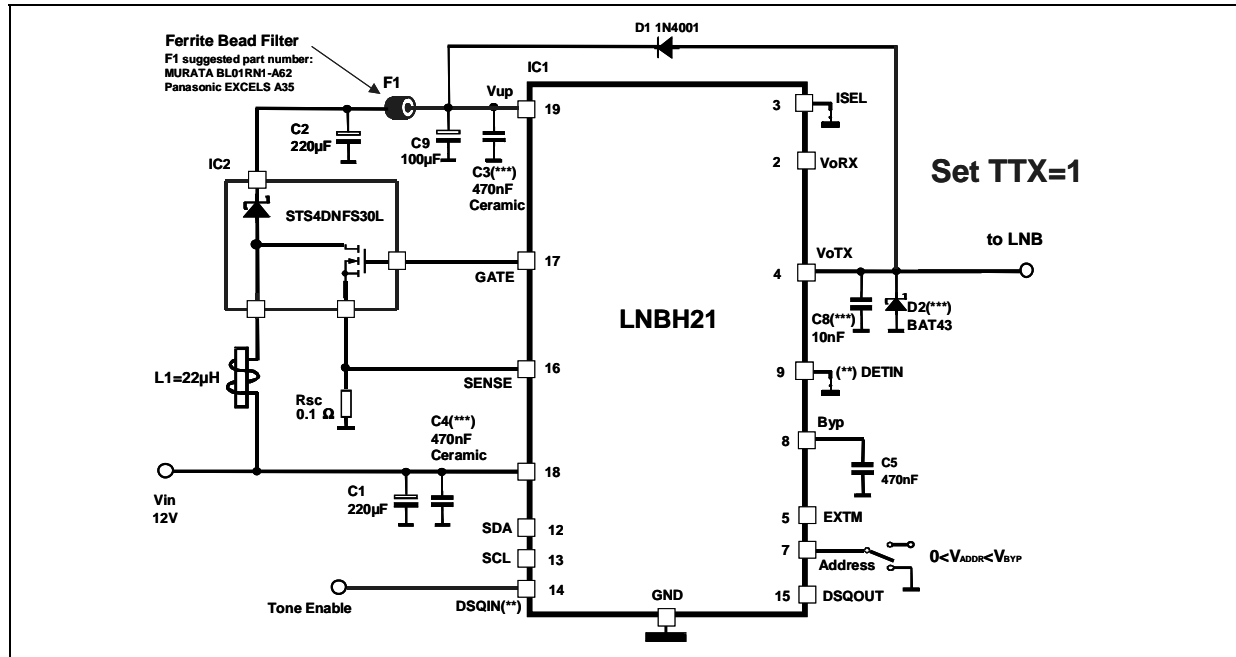

TABLE A: PIN CONFIGURATIONS

PIN N°	SYMBOL	NAME	FUNCTION
18	V _{CC}	Supply Input	8V to 15V IC supply. A 220µF bypass capacitor to GND with a 470nF (ceramic) in parallel is recommended
17	GATE	External Switch Gate	External MOS switch Gate connection of the step-up converter
16	SENSE	Current Sense Input	DC/DC Current Sense comparator input. Connected to current sensing resistor
19	V _{UP}	Step-up Voltage	Input of the linear post-regulator. The voltage on this pin is monitored by internal step-up controller to keep a minimum dropout across the linear pass transistor
2	V _O RX	Output Port during 22KHz Tone RX	RX Output to the LNB in DiSEqC 2.0 application. See truth tables for voltage selections on page 8 and description on page 5.
12	SDA	Serial Data	Bidirectional data from/to I ² C bus.
13	SCL	Serial Clock	Clock from I ² C bus.
14	DSQIN	DiSEqC Input	When the TEN bit of the System Register is LOW, this pin will accept the DiSEqC code from the main µcontroller. The LNBH21 will use this code to modulate the internally generated 22kHz carrier. Set to GND this pin if not used.
9	DETIN	Tone Detector Input	22kHz Tone Detector Input. Must be AC coupled to the DiSEqC 2.0 bus.
15	DSQOUT	DiSEqC Output	Open drain output of the tone Detector to the main µcontroller for DiSEqC 2.0 data decoding. It is LOW when tone is detected.
5	EXTM	External Modulator	External Modulation Input acts on V _O TX. Needs DC decoupling to the AC source. If not used, can be left open.
1, 6, 10, 11, 20	GND	Ground	Pins Connected to Ground.
8	BYP	Bypass Capacitor	Needed for internal preregulator filtering
3	ISEL	Current Limit Select	Set high or floating for I _{OUT} ≤ 750mA, connect to ground for I _{OUT} ≤ 450mA.
4	V _O TX	Output Port during 22KHz Tone TX	Output of the linear post-regulator/modulator to the LNB. See truth tables for voltage selections.
7	ADDR	Address Setting	Four I ² C bus addresses available by setting the Address Pin level voltage. See address pin characteristics table.

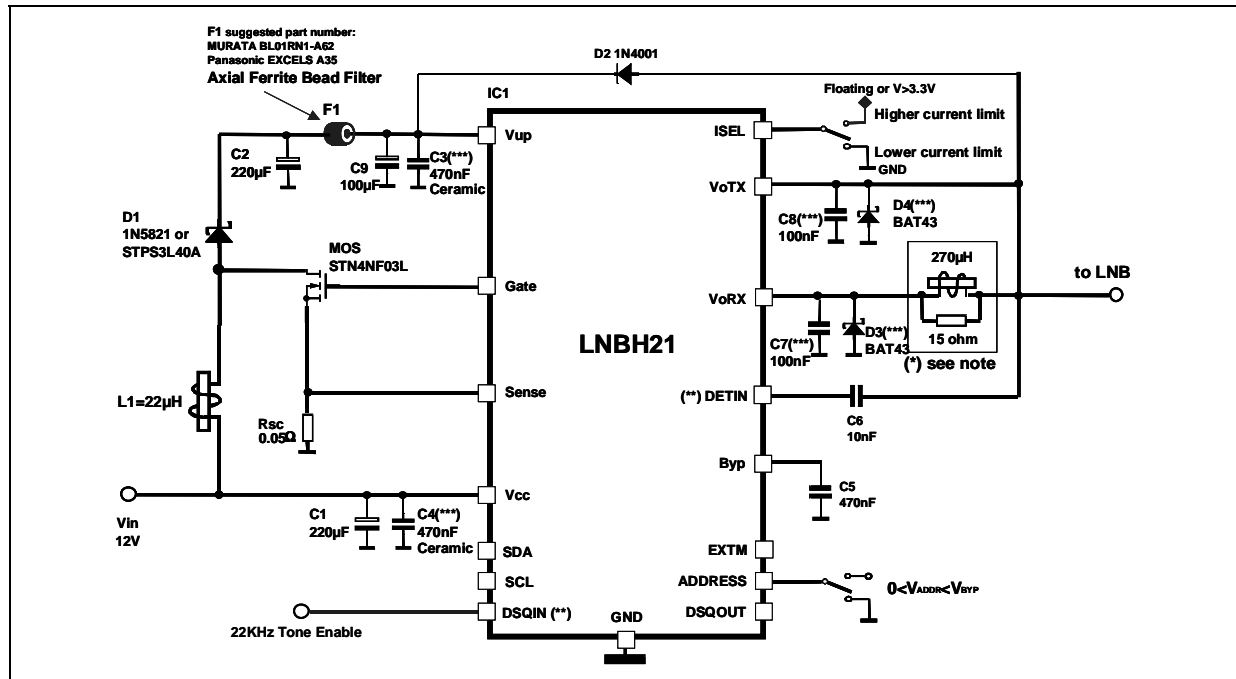

LN BH21

TYPICAL APPLICATION CIRCUITS

Application Circuit for DiSEqC 1.x and Output Current < 450 mA

Full Application Circuit for Bi-directional DiSEqC 2.0 and Output Current up to 750mA

(*) Filter to be used according to EUTELSAT recommendation to implement the DiSEqC™ 2.0, (see DiSEqC™ implementation on page 8). If bidirectional DiSEqC™ 2.0 is not implemented it can be removed both with C8 and D4.

(**) Do not leave these pins floating if not used.

(***) To be soldered as close as possible to relative pins.

-C8 and D3,4 are needed only to protect the output pins from any negative voltage spikes during high speed voltage transitions.

APPLICATION INFORMATION

This IC has a built in DC/DC step-up controller that, from a single supply source ranging from 8 to 15V, generates the voltages (V_{UP}) that let the linear post-regulator to work at a minimum dissipated power of 1.65W typ. @ 750mA load (the linear regulator drop voltage is internally kept at: $V_{UP}-V_O=2.2V$ typ.). An UnderVoltage Lockout circuit will disable the whole circuit when the supplied V_{CC} drops below a fixed threshold (6.7V typically). The internal 22KHz tone generator is factory trimmed in accordance to the standards, and can be controlled either by the I^2C^{TM} interface or by a dedicated pin (DSQIN) that allows immediate DiSeqCTM data encoding (*). When the TEN (Tone ENable) I^2C bit it is set to HIGH, a continuous 22KHz tone is generated on the output regardless of the DSQIN pin logic status.

The TEN bit must be set LOW when the DSQIN pin is used for DiSeqCTM encoding. The fully bi-directional DiSeqCTM 2.0 interfacing is completed by the built-in 22KHz tone detector. Its input pin (DETIN) must be AC coupled to the DiSeqCTM bus, and the extracted PWK data are available on the DSQOUT pin (*).

To comply to the bi-directional DiSeqCTM 2.0 bus hardware requirements an output R-L filter is needed. The LNBH21 is provided with two output pins: the V_{OTX} to be used during the tone transmission and the V_{ORX} to be used when the tone is received. This allows the 22KHz Tone to pass without any losses due to the R-L filter impedance (see DiSeqC 2.0 application circuit on page 5). In DiSeqC 2.0 applications during the 22KHz transmission activated by DSQIN pin (or TEN I^2C bit), the V_{OTX} pin must be preventively set ON by the TTX I^2C bit and, both the 13/18V power supply and the 22KHz tone, are provided by mean of V_{OTX} output. As soon as the tone transmission is expired, the V_{OTX} must be set to OFF by setting the TTX I^2C bit to zero and the 13/18V power supply is provided to the LNB by the V_{ORX} pin through the R-L filter. When the LNBH21 is used in DiSeqC 1.x applications the R-L filter is not required (see DiSeqC 1.x application circuit on pag.5), the TTX I^2C bit must be kept always to HIGH so that, the V_{OTX} output pin can provide both the 13/18V power supply and the 22KHz tone, enabled by DSQIN pin or by TEN I^2C bit.

All the functions of this IC are controlled via I^2C^{TM} bus by writing 6 bits on the System Register (SR, 8 bits). The same register can be read back, and two bits will report the diagnostic status. When the IC is put in Stand-by (EN bit LOW), the power blocks are disabled. When the regulator blocks are active (EN bit HIGH), the output can be logic controlled to be 13 or 18 V by mean of the V_{SEL} bit (Voltage SElect) for remote controlling of non-DiSeqC LNBs.

Additionally, the LNBH21 is provided with the LLC I^2C bit that increase the selected voltage value (+1V when $V_{SEL}=0$ and +1.5V when $V_{SEL}=1$) to compensate for the excess voltage drop along the coaxial cable (LLC bit HIGH).

By mean of the LLC bit, the LNBH21 is also compliant to the American LNB power supply standards that require the higher output voltage level to 19.5V (typ.) (instead of 18V), by simply setting the LLC=1 when $V_{SEL}=1$.

In order to improve design flexibility and to allow implementation of newcoming LNB remote control standards, an analogic modulation input pin is available (EXTM). An appropriate DC blocking capacitor must be used to couple the modulating signal source to the EXTM pin. Also in this case, the V_{OTX} output must be set ON during the tone transmission by setting the TTX bit high. When external modulation is not used, the relevant pin can be left open.

The current limitation block is SOA type and it is possible to select two current limit thresholds, by the dedicated I_{SEL} pin. The higher threshold is in the range of 750mA to 1A if the I_{SEL} is left floating or connected a voltage > 3.3V. The lower threshold is in the range of 450mA to 700mA when the I_{SEL} pin is connected to ground. When the output port is shorted to ground, the SOA current limitation block limits the short circuit current (I_{SC}) at typically 400mA or 200mA respectively for V_O 13V or 18V, to reduce the power dissipation. Moreover, it is possible to set the Short Circuit Current protection either statically (simple current clamp) or dynamically by the PCL bit of the I^2C SR; when the PCL (Pulsed Current Limiting) bit is set to LOW, the overcurrent protection circuit works dynamically, as soon as an overload is detected, the output is shut-down for a time T_{OFF} , typically 900ms. Simultaneously the OLF bit of the System Register is set to HIGH. After this time has elapsed, the output is resumed for a time $T_{ON}=1/10T_{OFF}$ (typ.). At the end of T_{ON} , if the overload is still detected, the protection circuit will cycle again through T_{OFF} and T_{ON} . At the end of a full T_{ON} in which no overload is detected, normal operation is resumed and the OLF bit is reset to LOW. Typical $T_{ON}+T_{OFF}$ time is 990ms and it is determined by an internal timer. This dynamic operation can greatly reduce the power dissipation in short circuit condition, still ensuring excellent power-on start up in most conditions.

However, there could be some cases in which an highly capacitive load on the output may cause a difficult start-up when the dynamic protection is chosen. This can be solved by initiating any power start-up in static mode (PCL=HIGH) and then switching to the dynamic mode (PCL=LOW) after a chosen amount of time. When in static mode, the OLF bit goes HIGH when the current clamp limit is reached and returns LOW when the overload condition is cleared.

This IC is also protected against overheating: when the junction temperature exceeds 150°C (typ.), the step-up converter and the linear regulator are shut off, and the OTF SR bit is set to HIGH. Normal operation is resumed and the OTF bit is reset to LOW when the junction is cooled down to 140°C (typ.).

(*): External components are needed to comply to bi-directional DiSEqC™ bus hardware requirements. Full compliance of the whole application with DiSEqC™ specifications is not implied by the use of this IC

I²C BUS INTERFACE

Data transmission from main μ P to the LNBH21 and viceversa takes place through the 2 wires I²C bus interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be externally connected).

DATA VALIDITY

As shown in fig. 1, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

START AND STOP CONDITIONS

As shown in fig.2 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH. A STOP conditions must be sent before each START condition.

BYTE FORMAT

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

ACKNOWLEDGE

The master (μ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 3). The peripheral (LNBH21) that acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse. The peripheral which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer. The LNBH21 won't generate the acknowledge if the V_{CC} supply is below the Undervoltage Lockout threshold (6.7V typ.).

TRANSMISSION WITHOUT ACKNOWLEDGE

Avoiding to detect the acknowledge of the LNBH21, the μ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking and decreases the noise immunity.

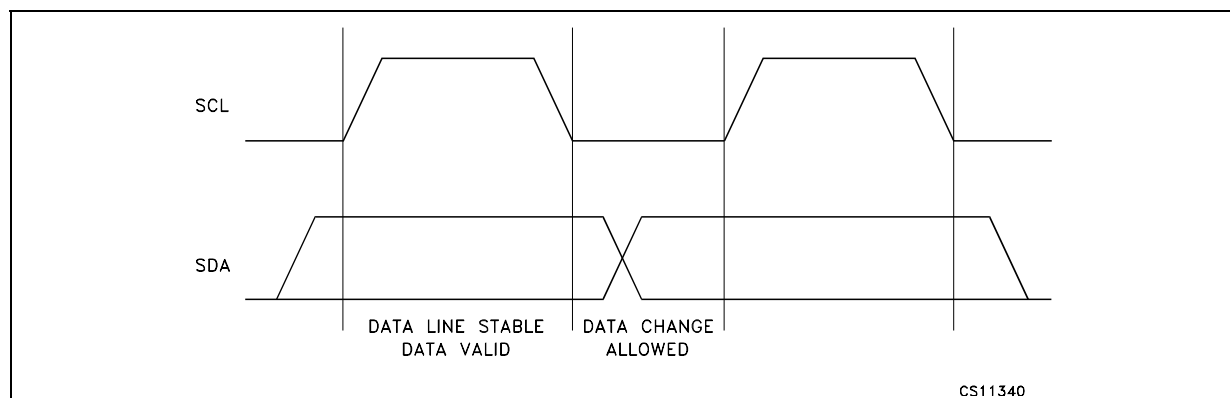

Figure 2 : TIMING DIAGRAM ON I²C BUS**Figure 3 : ACKNOWLEDGE ON I²C BUS**

LNBH21 SOFTWARE DESCRIPTION

INTERFACE PROTOCOL

The interface protocol comprises:

- A start condition (S)
- A chip address byte = hex 10 / 11 (the LSB bit determines read(=1)/write(=0) transmission)
- A sequence of data (1 byte + acknowledge)
- A stop condition (P)

ACK= Acknowledge; S = Start ; P = Stop; R/W = Read/Write

SYSTEM REGISTER (SR, 1 BYTE)

MSB							LSB
R, W	R, W	R, W	R, W	R, W	R, W	R	R
PCL	TTX	TEN	LLC	VSEL	EN	OTF	OLF

R, W = read and write bit; R = Read-only bit
All bits reset to 0 at Power-On

LNBH21

TRANSMITTED DATA (I²C BUS WRITE MODE)

When the R/W bit in the chip address is set to 0, the main μ P can write on the System Register (SR) of the LNBH21 via I²C bus. Only 6 bits out of the 8 available can be written by the μ P, since the remaining 2 are left to the diagnostic flags, and are read-only.

PCL	TTX	TEN	LLC	VSEL	EN	OTF	OLF	Function
			0	0	1	X	X	$V_O = 13.25\text{ V}$, $V_{UP} = 15.25\text{ V}$
			0	1	1	X	X	$V_O = 18\text{ V}$, $V_{UP} = 20\text{ V}$
			1	0	1	X	X	$V_O = 14.25\text{ V}$, $V_{UP} = 16.25\text{ V}$
			1	1	1	X	X	$V_O = 19.5\text{ V}$, $V_{UP} = 21.5\text{ V}$
		0			1	X	X	22KHz is controlled by DSQIN pin
		1			1	X	X	22KHz tone is ON, DSQIN pin disabled

	1	X			1	X	X	V_{OTX} output is ON, 22KHz controlled by DSQIN or TEN, output voltage level controlled by VSEL and LLC
0					1	X	X	Pulsed (dynamic) current limiting is selected
1					1	X	X	Static current limiting is selected
X	X	X	X	X	0	X	X	Power blocks disabled

X= don't care.

Values are typical unless otherwise specified

RECEIVED DATA (I²C bus READ MODE)

The LNBH21 can provide to the Master a copy of the SYSTEM REGISTER information via I2C bus in read mode. The read mode is Master activated by sending the chip address with R/W bit set to 1. At the following master generated clocks bits, the LNBH21 issues a byte on the SDA data bus line (MSB transmitted first).

At the ninth clock bit the MCU master can:

- acknowledge the reception, starting in this way the transmission of another byte from the LNBH21;
- no acknowledge, stopping the read mode communication.

While the whole register is read back by the μ P, only the two read-only bits OLF and OTF convey diagnostic informations about the LNBH21.

Values are typical unless otherwise specified.

PCL	TTX	TEN	LLC	VSEL	EN	OTF	OLF	Function
These bits are read exactly the same as they were left after last write operation						0		$T_J < 140^\circ\text{C}$, normal operation
						1		$T_J > 150^\circ\text{C}$, power block disabled
							0	$I_{OUT} < I_{OMAX}$, normal operation
							1	$I_{OUT} > I_{OMAX}$, overload protection triggered

Values are typical unless otherwise specified

POWER-ON I²C INTERFACE RESET

The I²C interface built in the LNBH21 is automatically reset at power-on. As long as the V_{CC} stays below the UnderVoltage Lockout threshold (6.7V typ.), the interface will not respond to any I²C command and the System Register (SR) is initialized to all zeroes, thus keeping the power blocks disabled. Once the V_{CC} rises above 7.3V typ, the I²C interface becomes operative and the SR can be configured by the main μ P. This is due to 500mV of hysteresis provided in the UVL threshold to avoid false retriggering of the Power-On reset circuit.

ADDRESS PIN

Connecting this pin to GND the Chip I²C interface address is 0001000, but, it is possible to choice among 4 different addresses simply setting this pin at 4 fixed voltage levels (see table on page 10).

DiSEqCTM IMPLEMENTATION

The LNBH21 helps the system designer to implement the bi-directional (2.0) DiSEqC protocol by allowing an easy PWK modulation/demodulation of the 22KHz carrier. The PWK data are exchanged between the LNBH21 and the main μ P using logic levels that are compatible with both 3.3 and 5V microcontrollers. This data exchange is made through two dedicated pins, DSQIN and DSQOUT, in order to maintain the timing relationships between the PWK data and the PWK modulation as accurate as possible. These two pins should be directly connected to two I/O pins of the μ P, thus leaving to the resident firmware the task of encoding and decoding the PWK data in accordance to the DiSEqC protocol. Full compliance of the system to the specification is thus not implied by the bare use of the LNBH21. The system designer should also take in consideration the bus hardware requirements; that can be simply accomplished by the R-L termination connected on the V_O pins of the LNBH21, as shown in the Typical Application Circuit on page 4. To avoid any losses due to the R-L impedance during the tone transmission, the LNBH21 has dedicated output ($V_{O}TX$) that, in a DiSEqC 2.0 application, is connected after the filter and must be enabled by setting the TTX SR bit HIGH only during the tone transmission (see DiSEqC 2.0 operation description on page 2).

Unidirectional (1.x) DiSEqC and non-DiSEqC systems normally don't need this termination, and the $V_{O}TX$ pin can be directly connected to the LNB supply port of the Tuner (see DiSEqC 1.x application circuit on pag.4). There is also no need of Tone Decoding, thus DETIN and DSQOUT pins can be left unconnected and the Tone is provided by the $V_{O}TX$.

THERMAL DESIGN NOTES

During normal operation, the LNBH21 device dissipates some power. At maximum rated output current (750mA), the voltage drop on the linear regulator lead to a total dissipated power that is typically 1.65W. The heat generated requires a suitable heatsink to keep the junction temperature below the over temperature protection threshold. Assuming a 45°C temperature inside the Set-Top-Box case, the total $R_{thj-amb}$ has to be less than 48°C/W.

While this can be easily achieved using a through-hole power package that can be attached to a small heatsink or to the metallic frame of the receiver, a surface mount power package must rely on PCB solutions whose thermal efficiency is often limited. The simplest solution is to use a large, continuous copper area of the GND layer to dissipate the heat coming from the IC body.

Given an $R_{thj-case}$ equal to 2°C/W, a maximum of 46°C/W are left to the PCB heatsink. This figure is achieved if a minimum of 6.5cm² copper area is placed just below the IC body. This area can be the inner GND layer of a multi-layer PCB, or, in a dual layer PCB, an unbroken GND area even on the opposite side where the IC is placed. In figure 4, it is shown a suggested layout for the PSO-20 package with a dual layer PCB, where the IC exposed pad connected to GND and the square dissipating area are thermally connected through 32 vias holes, filled by solder. This arrangement, when L=25mm, achieves an $R_{thc-amb}$ of about 32°C/W.

Different layouts are possible, too. Basic principles, however, suggest to keep the IC and its ground exposed pad approximately in the middle of the dissipating area; to provide as many vias as possible; to design a dissipating area having a shape as square as possible and not interrupted by other copper traces.
