Data Sheet

LRS1331
Stacked Chip
16M Flash Memory and 4M SRAM

FEATURES

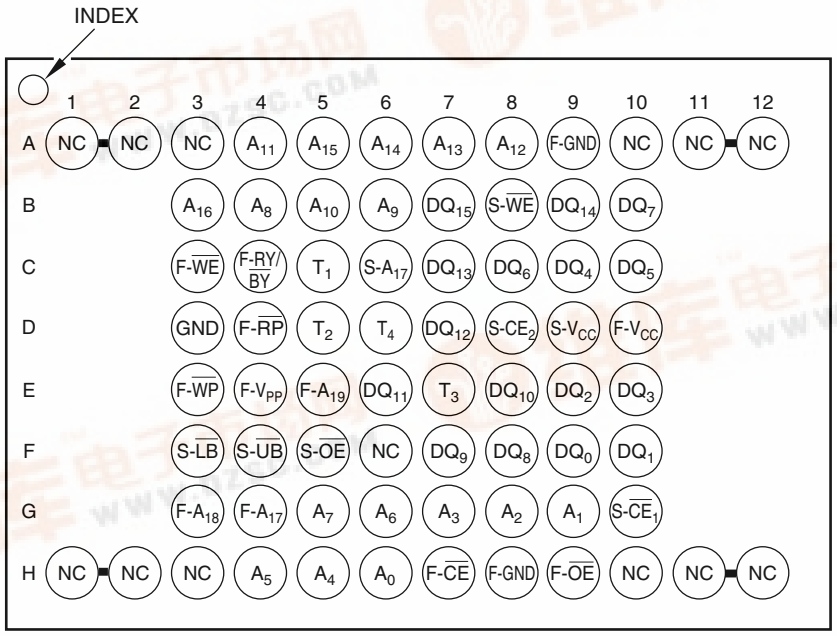
- Flash Memory and SRAM
- Stacked Die Chip Scale Package
- 72-ball 8 mm × 11 mm CSP plastic package
- Power supply: 2.7 V to 3.6 V
- Operating temperature: -25°C to +85°C
- Flash Memory
  - Access time (MAX.): 90 ns
  - Operating current (MAX.)
    (The current for F-V_{CC} pin and F-V_{CCW} pin):
    - Read: 25 mA (t_{CYCLE} = 200 ns)
    - Word write: 57 mA
    - Block erase: 42 mA
  - Standby current (the current for F-V_{CC} pin): 15 µA
    (MAX. F-$\overline{RP}$ ≤ GND ± 0.2 V)
  - Optimized array blocking architecture
    - Two 4K-word boot blocks
    - Six 4K-word parameter blocks
    - Thirty-one 32K-word main blocks
    - Bottom boot location
  - Extended cycling capability
    - 100,000 block erase cycles
  - Enhanced automated suspend options
    - Word write suspend to read
    - Block erase suspend to word write
    - Block erase suspend to read
- SRAM
  - Access time (MAX.): 85 ns
  - Operating current: 45 mA (MAX.)
  - Standby current: 15 µA (MAX.)
  - Data retention current: 2 µA (MAX.)

DESCRIPTION

The LRS1331 is a combination memory organized as 1,048,576 × 16-bit flash memory and 262,144 × 16-bit static RAM in one package.

PIN CONFIGURATION

72-BALL FBGA — TOP VIEW



NOTE: All F-GND and S-GND pins are connected on the board.
Two NC pins at the corner are connected.

NOTES:

1. L = V_{IL}, H = V_{IH}, X = H or L. Refer to DC Characteristics.
2. Refer to the 'Flash Memory Command Definition' section for valid address input and D_{IN} during a write operation.
3. F-$\overline{WP}$ set to V_{IL} or V_{IH}.
4. SRAM standby data. See Table 2a.
5. Command writes involving block erase or word write are reliably executed when V_{CCWH} (2.7 V to 3.6 V) and F-V_{CC} = 2.7 V to 3.6 V. Block erase or word write with F-V_{CCW} < V_{CCWH} (MIN.) produce spurious results and should not be attempted.
6. Never hold F-$\overline{OE}$ LOW and F-$\overline{WE}$ LOW at the same timing.
7. S-$\overline{LB}$, S-$\overline{UB}$ Control Mode. See Table 2b.

NOTES:
1. Commands other than those shown in table are reserved by SHARP for future device implementations and should not be used.
2. BUS operations are defined in Table 2.
3. XA = Any valid address within the device;
   IA = Identifier code address;
   BA = Address within the block being erased;
   WA = Address of memory location to be written;
   SRD = Data read from status register;
   WD = Data to be written at location WA. Data is latched on the rising edge of F-$\overline{WE}$ or F-$\overline{CE}$ (whichever goes HIGH first);
   ID = Data read from identifier codes.
4. See Table 4 for Identifier Codes.
5. See Table 5 for Write Protection Alternatives.
6. If the permanent lock-bit is set, Set Block Lock-Bit and Clear Block Lock-Bits commands cannot be done.
7. The clear block lock-bits operation simultaneously clears all block lock-bits.

Table 6. Status Register Definition

WSMS	BESS	ECBLBS	WBWSLBS	VCCWS	WBWSS	DPS	R
7	6	5	4	3	2	1	0

SR.7 = Write State Machine Status (WSMS)
- 1 = Ready
- 0 = Busy

SR.6 = Erase Suspend Status (BESS)
- 1 = Block Erase Suspended
- 0 = Block Erase in Progress/Completed

SR.5 = Erase and Clear Block Lock-Bits Status (ECBLBS)
- 1 = Error in Block Erase, Bank Erase or Clear Block Lock-Bits
- 0 = Successful Block Erase, Bank Erase or Clear Block Lock-Bits

SR.4 = Word/Byte Write and Set Lock-Bit Status (WBWSLBS)
- 1 = Error in Word/Byte Write or Set Block/Permanent Lock-Bit
- 0 = Successful Word/Byte Write or Set Block/Permanent Lock-Bit

SR.3 = V_{CCW} Status (VCCWS)
- 1 = V_{CCW} LOW Detect, Operation Abort
- 0 = V_{CCW} Okay

SR.2 = Word/Byte Write Suspend Status (WBWSS)
- 1 = Word/Byte Write Suspended
- 0 = Word/Byte Write in Progress/Completed

SR.1 = Device Protect Status (DPS)
- 1 = Block Lock-Bits, Permanent Lock-Bits and/or F-$\overline{WP}$ Lock Detected, Operation Abort
- 0 = Unlock

SR.0 = Reserved for future enhancements (R)

NOTES:
1. Check SR.7 to determine block erase, bank erase, word/byte write or lock-bit configuration completion. SR.6 - SR.0 are invalid while SR.7 = 0.
2. If both SR.5 and SR.4 are '1's after a block erase, bank erase or lock-bit configuration attempt, an improper command sequence was entered.
3. SR.3 does not provide a continuous indication of F-V_{CCW} level. The WSM interrogates and indicates the F-V_{CCW} level only after block erase, bank erase, word/byte write or lock-bit configuration command sequences. SR.3 is not guaranteed to report accurate feedback only when F-$V_{CCW} \neq$ F-V_{CCWH}.
4. SR.1 does not provide a continuous indication of permanent and block lock-bit and F-$\overline{WP}$ values. The WSM interrogates the permanent lock-bit, block lock-bit and F-$\overline{WP}$ only after block erase, bank erase, word/byte write or lock-bit configuration command sequences. It informs the system, depending on the attempted operation, if the block lock-bit is set, permanent lock-bit is set and/or F-$\overline{WP}$ is V_{IL}. Reading the block lock and permanent lock configuration codes after writing the Read Identifier codes command indicates permanent and block lock-bit status..
5. SR.0 is reserved for future use and should be masked out when polling the status register.

F-$\overline{RP}$ LOW to Reset during Block Erase or Word Write	t_{PLRZ}		20	µs	1, 2
F-V_{CC} 2.7 V to F-$\overline{RP}$ HIGH	t_{VPH}	100		ns	3

NOTES:
1. If F-$\overline{RP}$ is asserted while a block erase or word write operation is not executing, the reset will complete with 100 ns.
2. A reset time t_{PHQV} is required from F-RY/$\overline{BY}$ going HIGH Z, or F-$\overline{RP}$ going HIGH until outputs are valid.
3. When the device power-up, holding F-$\overline{RP}$ LOW minimum 100 ns is required after V_{CC} has been in predefined range and also has been stable there.

NOTES:

1. A write occurs during the overlap of a LOW S-$\overline{CE}_1$, a HIGH S-CE_2 and a LOW S-$\overline{WE}$, A write begins at the latest transition among S-$\overline{CE}_1$ going LOW, S-CE_2 going HIGH and S-$\overline{WE}$ going LOW. A write ends at the earliest transition among S-$\overline{CE}_1$ going HIGH, S-CE_2 going LOW and S-$\overline{WE}$ going HIGH. t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of S-$\overline{CE}_1$ going LOW or S-CE_2 going HIGH to the end of write.
3. t_{BW} is measured from the time of going LOW S-$\overline{UB}$ or LOW S-$\overline{LB}$ to the end of write.
4. t_{AS} is measured from the address valid to the beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as S-$\overline{CE}_1$ going HIGH, S-CE_2 going LOW or S-$\overline{WE}$ going HIGH.
6. During this period, DQ pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
7. If S-$\overline{CE}_1$ goes LOW or S-CE_2 goes HIGH simultaneously with S-$\overline{WE}$ going LOW or after S-$\overline{WE}$ going LOW, the outputs remain in HIGH impedance state.
8. If S-$\overline{CE}_1$ goes HIGH or S-CE_2 goes LOW simultaneously with S-$\overline{WE}$ going HIGH or S-$\overline{WE}$ going HIGH, the outputs remain in HIGH impedance state.

GENERAL DESIGN GUIDELINES

Supply Power

Maximum difference (between F-V_{CC} and S-V_{CC}) of the voltage is less than 0.3 V.

Power Supply and Chip Enable of Flash Memory and SRAM

S-$\overline{CE}_1$ should not be LOW and S-CE_2 should not be HIGH when F-$\overline{CE}$ is LOW simultaneously.

If the two memories are active together, they may not operate normally because of interference noises or data collision on DQ bus.

Both F-V_{CC} and S-V_{CC} need to be applied by the recommended supply voltage at the same time except SRAM data retention mode.

Power Up Sequence

When turning on Flash memory power supply, keep F-$\overline{RP}$ LOW. After F-V_{CC} reaches over 2.7 V, keep F-$\overline{RP}$ LOW for more than 100 ns.

Device Decoupling

The power supply needs to be designed carefully because one of the SRAM and the Flash Memory is in standby mode when the other is active. A careful decoupling of power supplies is necessary between SRAM and Flash Memory. Note peak current caused by transition of control signals (F-$\overline{CE}$, S-$\overline{CE}_1$, S-CE_2).

FLASH MEMORY DATA PROTECTION

Noises having a level exceeding the limit specified in the specification may be generated under specific operating conditions on some systems.

Such noises, when induced onto F-$\overline{WE}$ signal or power supply may be interpreted as false commands, causing undesired memory updating.

To protect the data store in the flash memory against unwanted overwriting, systems operating with the flash memory should have the following write protect designs, as appropriate:

Protecting Data in Specific Block

By setting a F-$\overline{WP}$ to LOW, only the boot block can be protected against overwriting.

Parameter and main blocks with F-$\overline{WP}$ cannot be locked.

System program, etc., can be locked by storing them in the book block.

For further information on setting/resetting of block bit, and controlling of F-$\overline{WP}$ and F-$\overline{RP}$, refer to the specification, see the Command Definitions section.

Data Protection Through F-V_{CCW}

When the level of F-V_{CCW} is lower than F-V_{CCWK} (lockout voltage), write operation on the flash memory is disabled. All blocks are locked and the data in the blocks are completely write protected.

For the lockout voltage refer to the 'DC Characteristics' section.

Data Protection During Voltage Transition

DATA PROTECTION THROUGH F-$\overline{RP}$

When the F-$\overline{RP}$ is kept LOW during power up and power down sequence, write operation on the flash memory is disabled, write protecting all blocks.

For details of F-$\overline{RP}$ control refer to the 'Flash Memory AC Electrical Characteristics' section.

DESIGN CONSIDERATIONS

Power Supply Decoupling

To avoid a bad effect on the system by flash memory power switching characteristics, each device should have a 0.1 µF ceramic capacitor connected between its V_{CC} and GND and between its V_{CCW} and GND. LOW inductance capacitors should be placed as close as possible to package leads.

V_{CCW} Trace on Printed Circuit Boards

Updating the memory contents of flash memories that reside in the target system requires that the printed circuit board designer pay attention to the V_{CCW} Power Supply trace. Use similar trace widths and layout considerations given to the V_{CC} power bus.

The Inhibition of Overwrite Operation

Please do not execute reprogramming '0' for the bit which has already been programmed '0'. Overwrite operation may generate unerasable bit. In case of reprogramming '0' to the data which has been programmed '1'.

- Program '0' for the bit in which you want to change data from '1' to '0'.
- Program '1' for the bit which has already been programmed '0'.

For example, changing data from '1011110110111101' to '1010110110111100' requires '1110111111111110' programming.

Power Supply

Block erase, full chip erase, word write and lock-bit configuration with an invalid V_{CCW} (see 'DC Characteristics') produce spurious results and should not be attempted. Device operations at invalid V_{CC} voltage product spurious results and should not be attempted.

LIFE SUPPORT POLICY

SHARP components should not be used in medical devices with life support functions or in safety equipment (or similiar applications where component failure would result in loss of life or physical harm) without the written approval of an officer of the SHARP Corporation.

LIMITED WARRANTY

SHARP warrants to its Customer that the Products will be free from defects in material and workmanship under normal use and service for a period of one year from the date of invoice. Customer's exclusive remedy for breach of this warranty is that SHARP will either (i) repair or replace, at its option, any Product which fails during the warranty period because of such defect (if Customer promptly reported the failure to SHARP in writing) or, (ii) if SHARP is unable to repair or replace, refund the purchase price of the Product upon its return to SHARP. This warranty does not apply to any Product which has been subjected to misuse, abnormal service or handling, or which has been altered or modified in design or construction, or which has been serviced or repaired by anyone other than Sharp. The warranties set forth herein are in lieu of, and exclusive of, all other warranties, express or implied. ALL EXPRESS AND IMPLIED WARRANTIES, INCLUDING THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR USE AND FITNESS FOR A PARTICULAR PURPOSE, ARE SPECIFICALLY EXCLUDED. In no event will Sharp be liable, or in any way responsible, for any incidental or consequential economic or property damage.

The above warranty is also extended to Customers of Sharp authorized distributors with the following exception: reports of failures of Products during the warranty period and return of Products that were purchased from an authorized distributor must be made through the distributor. In case Sharp is unable to repair or replace such Products, refunds will be issued to the distributor in the amount of distributor cost.

SHARP reserves the right to make changes in specifications at any time and without notice. SHARP does not assume any responsibility for the use of any circuitry described; no circuit patent licenses are implied.
