

# M52749FP

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

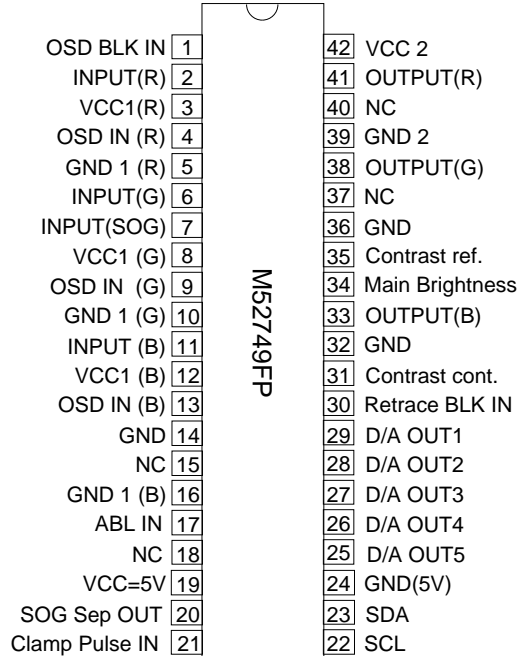

## DISCRIPTION

M52749FP is Semiconductor Integrated Circuit for CRT Display Monitor. It includes OSD Blanking, OSD Mixing, Retrace Blanking, Wide Band Amplifier, Brightness Control. Main/Sub Contrast and OSD Adjust Function .

## FEATURES

- Frequency Band Width: RGB 180MHz(3Vp-p at -3dB)  
OSD 80MHz
- Input : RGB 0.7Vp-p(Typ)  
OSD 3Vp-p minimum(positive)  
BLK(for OSD) 3Vp-p minimum(positive)  
Retrace BLK 3Vp-p minimum(positive)
- Output : RGB 5.5Vp-p(maximum)  
OSD 3.5Vp-p(maximum)
- Main Contrast , Sub Contrast , OSD Adjust and 5ch D/A OUT can be controlled by I2C Bus.

## PIN CONFIGURATION

Package:42P9R

## STRUCTURE

Bipolar Silicon Monolithic IC

## APPLICATION

CRT Display Monitor

## RECOMMENDED OPERATING CONDITIONS

Supply Voltage Range	11.5V~12.5V(V3,V8,V12,V42) 4.5V~5.5V(V19)
Rated Supply Voltage	12.0V(V3,V8,V12,V42) 5.0V(V19)

## MAJOR SPECIFICATION

Bus Controlled 3ch Video Pre-Amp with OSD Mixing Function and Retrace Blanking Function

# M52749FP

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

Fig. 1 Block Diagram

**Absolute Maximum Rating (Ambient temperature: 25 °C)**

Parameter	Symbol	Rating	Unit
Supply voltage(PIN3,8,12,42)	Vcc 12	13.0	V
Supply voltage(PIN19)	Vcc 5	6.0	V
Power dissipation	Pd	2900	mW
Ambient temperature	Topr	-20~+75	°C
Storage temperature	Tstg	-40~+150	°C
Recommended supply12	Vopr12	12.0	V
Recommended supply5	Vopr5	5.0	V
voltage range12	Vopr'12	11.5~12.5 (TYP 12.0)	V
voltage range5	Vopr'5	4.5~5.5 (TYP 5.0)	V

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

- Note1) Measuring conditions are as listed in supplementary Table. Measured with a current meter at test point IA.
- Note2) Measuring conditions are as listed in supplementary Table. Measured with a current meter at test point IB.
- Note3) Decrease V34 gradually, and measure the voltage when the bottom of waveform output is distorted. The voltage is called VOL.  
Next, increase V34 gradually, and measure the voltage when the top of waveform output is distorted. The voltage is called VOH.  
Voltage Vomax is calculated by the equation below:

- Note4) Increase the input signal(SG2) amplitude gradually, starting from 700mVp-p. Measure the amplitude of the input signal when the output signal starts becoming distorted.
- Note5) Input SG1, and read the amplitude output at OUT(33,38,41). The amplitude is called VOUT(33,38,41).Maximum gain GV is calculated by the equation below:  

$$GV=20 \text{ LOG } \frac{V_{OUT}}{0.7} \text{ (dB)}$$
- Note6) Relative maximum gain  $\Delta GV$  is calculated by the equation below:  

$$\Delta GV=V_{OUT}(33)/V_{OUT}(38), V_{OUT}(38)/V_{OUT}(41), V_{OUT}(41)/V_{OUT}(33)$$
- Note7) Measuring the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41). Main contrast control characteristics VC1 is calculated by the equation below:  

$$VC1=20 \text{ LOG } \frac{V_{OUT}}{0.7} \text{ (dB)}$$
- Note8) Relative characteristics  $\Delta VC1$  is calculated by the equation below:  

$$\Delta VC1=V_{OUT}(33)/V_{OUT}(38) , V_{OUT}(38)/V_{OUT}(41) , V_{OUT}(41)/V_{OUT}(33)$$
- Note9) Measuring condition and procedure are the same as described in Note7.
- Note10) Measuring condition and procedure are the same as described in Note8.
- Note11) Measuring the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41).
- Note12) Measuring condition and procedure are the same as described in Note8.

Note13) Measure the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41). Sub contrast control characteristics VSC1 is calculated by the equation below:

$$VSC1=20 \text{ LOG } \frac{VOUT}{0.7} \quad (\text{dB})$$

Note14) Relative characteristics  $\Delta VSC1$  is calculated by the equation below:

$$\Delta VSC1=VOUT(33)/VOUT(38) , VOUT(38)/VOUT(41) , VOUT(41)/VOUT(33)$$

Note15) Measuring condition and procedure are the same as described in Note13.

Note16) Measuring condition and procedure are the same as described in Note14.

Note17) Measure the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41).

Note18) Measuring condition and procedure are the same as described in Note14.

Note19) Measure the amplitude output at OUT(33,38,41). The measured value is called VMSC.

Note20) Relative characteristics  $\Delta VMSC$  is calculated by the equation below:

$$\Delta VMSC=VOUT(33)/VOUT(38) , VOUT(38)/VOUT(41) , VOUT(41)/VOUT(33)$$

Note21) Measure the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41), and is treated as ABL1.

Note22) Relative characteristics ABL1 is calculated by the equation below:

$$ABL1=VOUT(33)/VOUT(38) , VOUT(38)/VOUT(41) , VOUT(41)/VOUT(33)$$

Note23) Measuring condition and procedure are the same as described in Note21.

Note24) Measuring condition and procedure are the same as described in Note22.

Note25) Measure the DC voltage at OUT(33,38,41) with a voltmeter. The measured value is called VOUT(33,38,41), and is treated as VB1.

Note26) Relative characteristics  $\Delta VB1$  is calculated by the difference in the output between the channels.

$$\Delta VB1=VOUT(33)\text{Å}VOUT(38) , VOUT(38)\text{Å}VOUT(41) , VOUT(41)\text{Å}VOUT(33)$$

Note27) Measuring condition and procedure are the same as described in Note25.

Note28) Measuring condition and procedure are the same as described in Note26.

Note29) Measuring condition and procedure are the same as described in Note25.

Note30) Measuring condition and procedure are the same as described in Note26.

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

Note31) First, SG3 to 1MHz is as input signal. Input a resistor that is about 2KOhm to offer the voltage at input pins(2,6,11) in order that the bottom of input signal is 2.5V.  
 Control the main contrast in order that the amplitude of sine wave output is 4.0Vp-p.  
 Control the brightness in order that the bottom of sine wave output is 2.0Vp-p.  
 By the same way, measure the output amplitude when SG3 to 50MHz is as input signal.  
 The measured value is called VOUT(33,38,41).  
 Frequency characteristics FC1(33,38,41) is calculated by the equation below:

$$FC1=20 \text{ LOG } \frac{VOUT \text{ Vp-p}}{\text{output amplitude when inputted SG3(1MHz) : 4.0Vp-p}} \quad (\text{dB})$$

Note32) Relative characteristics  $\Delta FC1$  is calculated by the difference in the output between the channels.  
 Note33) Measuring condition and procedure are the same as described in Note31,except SG3 to 180MHz.  
 Note34) Relative characteristics  $\Delta FC1'$  is calculated by the difference in the output between the channels.  
 Note35) SG3 to 1MHz is as input signal. Control the main contrast in order that the amplitude of sine wave output is 1.0Vp-p.  
 By the same way, measure the output amplitude when SG3 to 150MHz is as input signal.  
 The measured value is called VOUT(33,38,41).  
 Frequency characteristics FC2(33,38,41) is calculated by the equation below:

$$FC2=20 \text{ LOG } \frac{VOUT \text{ Vp-p}}{\text{output amplitude when inputted SG3(1MHz) : 4.0Vp-p}} \quad (\text{dB})$$

Note36) Relative characteristics  $\Delta FC2$  is calculated by the difference in the output between the channels.  
 Note37) Input SG3 (50MHz) to pin2 only, and then measure the waveform amplitude output at OUT(33,38,41).The measured value is called VOUT(33,38,41).  
 Crosstalk CT1 is calculated by the equation below:

$$CT1=20 \text{ LOG } \frac{VOUT(33,38)}{VOUT(41)} \quad (\text{dB})$$

Note38) Measuring condition and procedure are the same as described in Note37,except SG3 to 180MHz.  
 Note39) Input SG3 (50MHz) to pin6 only, and then measure the waveform amplitude output at OUT(33,38,41).The measured value is called VOUT(33,38,41).  
 Crosstalk CT2 is calculated by the equation below:

$$CT2=20 \text{ LOG } \frac{VOUT(33,41)}{VOUT(38)} \quad (\text{dB})$$

Note40) Measuring condition and procedure are the same as described in Note39,except SG3 to 180MHz.  
 Note41) Input SG3 (50MHz) to pin11 only, and then measure the waveform amplitude output at OUT(33,38,41).The measured value is called VOUT(33,38,41).  
 Crosstalk CT2 is calculated by the equation below:

$$CT3=20 \text{ LOG } \frac{VOUT(38,41)}{VOUT(33)} \quad (\text{dB})$$

Note42) Measuring condition and procedure are the same as described in Note41,except SG3 to 180MHz.

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

- Note43) Control the main contrast (00H) in order that the amplitude of output signal is 3.0Vp-p.  
Control the brightness (V34) in order that the Black level of output signal is 2.0V.  
Measure the time needed for the input pulse to rise from 10% to 90% (Tr1) and for the output pulse to rise from 10% to 90% (Tr2) with an active probe.  
Pulse characteristics Tr is calculated by the equations below :

$$Tr = \sqrt{(Tr2)^2 - (Tr1)^2} \text{ (nsec)}$$

- Note44) Measure the time needed for the input pulse to fall from 90% to 10% (Tf1) and for the output pulse to fall from 90% to 10% (Tf2) with an active probe.  
Pulse characteristics Tf is calculated by the equations below :

$$Tf = \sqrt{(Tf2)^2 - (Tf1)^2} \text{ (nsec)}$$

- Note45) Turn down the SG5 input level gradually from 5.0Vp-p, monitoring the waveform output. Measure the top level of input pulse when the output pedestal voltage turn decrease with unstable.
- Note46) Decrease the SG5 pulse width gradually from 0.5us, monitoring the output. Measure the SG5 pulse width (a point of 1.5V) when the output pedestal voltage turn decrease with unstable.

**M52749FP**

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

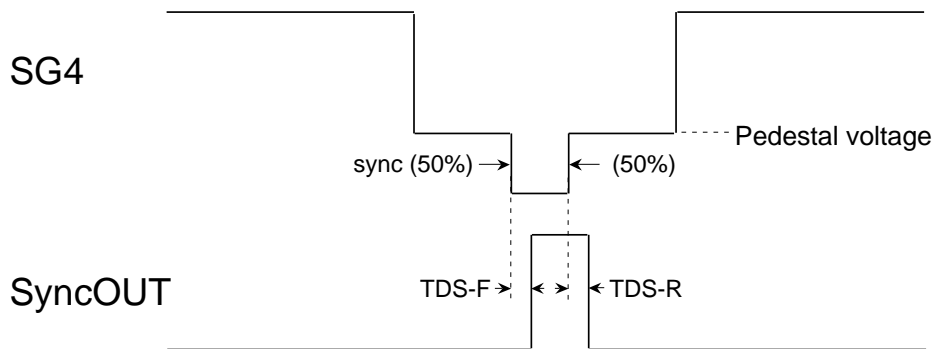

- Note47) Measure the time needed for the output pulse to rise from 10% to 90% (OTr) with an active probe.
- Note48) Measure the time needed for the output pulse to fall from 90% to 10% (OTf) with an active probe.
- Note49) Measure the amplitude output at OUT(33,38,41). The measured value is called VOUT(33,38,41), and is treated as Oaj1.
- Note50) Relative characteristics  $\Delta Oaj1$  is calculated by the equation below:  

$$\Delta Oaj1 = \frac{VOUT(33)}{VOUT(38)} \cdot \frac{VOUT(38)}{VOUT(41)} \cdot \frac{VOUT(41)}{VOUT(33)}$$
- Note51) Measuring condition and procedure are the same as described in Note49.
- Note52) Measuring condition and procedure are the same as described in Note50.
- Note53) Measuring condition and procedure are the same as described in Note49.
- Note54) Measuring condition and procedure are the same as described in Note50.
- Note55) Reduce the SG6 input level gradually, monitoring output.  
 Measure the SG6 level when the output reaches 0V. The measured value is called VthOSD.
- Note56) Confirm that output signal is being blanked by the SG6 at the time.  
 Monitoring to output signal, decreasing the level of SG6. Measure the top level of SG6 when the blanking period is disappeared. The measured value is called VthBLK.
- Note57) Measure the amplitude output is blanked by the SG7 at OUT(33,38,41). The measured value is called VOUT(33,38,41), and is treated as HBLK1.
- Note60) Confirm that output signal is being blanked by the SG7 at the time.  
 Monitoring to output signal, decreasing the level of SG7. Measure the top level of SG7 when the blanking period is disappeared. The measured value is called VthRET.

BUS CONTROLLED 3CH VIDEO PRE-AMP FOR CRT DISPLAY MONITOR

- Note61) The sync's amplitude of SG4 be changed all white into all black, increase from 0Vp-p to 0.02Vp-p. No pulse output permitted.
- Note62) The sync's amplitude of SG4 be changed all white or all black, decrease from 0.3Vp-p to 0.2Vp-p. Confirm no malfunction produced by noise.
- Note63) Measure the high voltage at SyncOUT. The measured value is treated as VSH.
- Note64) Measure the low voltage at SyncOUT. The measured value is treated as VSL.
- Note65) SyncOUT becomes High with sink part of SG4.  
Measure the time needed for the rear edge of SG4 sink to fall from 50% and for SyncOUT to rise from 50% with an active prove. The measured value is treated as TDS-F ,less than 90nsec.
- Note66) Measure the time needed for the rear edge of SG4 sink to rise from 50% and for SyncOUT to fall from 50% with an active prove. The measured value is treated as TDS-R ,less than 90nsec.

- Note67) Measure the DC voltage at D/AOUT. The measured value is treated as VOH.
- Note68) Measure the DC voltage at D/AOUT. The measured value is treated as VOL.
- Note69) IA- is minimum input-current when input 1Vdc to D/AOUT.

- Note69a) IA+ is maximum output-current from D/AOUT.
- Note70) The difference of differential non- linearity of D/AOUT must be less than  $\pm 1.0$ LSB.

## Application Method for M52749SP

### CLAMP PULSE INPUT

Clamp pulse width is recommended

- above 15 KHz, 1.0 usec
- above 30 KHz, 0.5 usec
- above 64 KHz, 0.3 usec .

The clamp pulse circuit in ordinary set is a long round about way, and beside high voltage, sometimes connected to external terminal, it is very easy affected by large surge. Therefore, the Fig. shown right is recommended.

### Notice of application

Make the nearest distance between output pin and pull down resistor.  
Recommended pedestal voltage of IC output signal is 2V.
