

Designer's™ Data Sheet

NPN Silicon Power Transistors

1.5 kV SWITCHMODE Series

These transistors are designed for high-voltage, high-speed, power switching in inductive circuits where fall time is critical. They are particularly suited for line-operated switchmode applications.

Typical Applications: Features:

- Switching Regulators
- Inverters
- Solenoids
- Relay Drivers
- Motor Controls
- Deflection Circuits
- Collector–Emitter Voltage — $V_{CEV} = 1500$ Vdc
- Fast Turn–Off Times
 - 80 ns Inductive Fall Time — 100°C (Typ)
 - 110 ns Inductive Crossover Time — 100°C (Typ)
 - 4.5 μ s Inductive Storage Time — 100°C (Typ)
- 100°C Performance Specified for:
 - Reverse–Biased SOA with Inductive Load
 - Switching Times with Inductive Loads
 - Saturation Voltages
 - Leakage Currents

MAXIMUM RATINGS

Rating	Symbol	MJ16018	MJW16018	Unit
Collector–Emitter Voltage	$V_{CEO(sus)}$	800		Vdc
Collector–Emitter Voltage	V_{CEV}	1500		Vdc
Emitter–Base Voltage	V_{EB}	6		Vdc
Collector Current — Continuous	I_C	10		Adc
— Peak(1)	I_{CM}	15		
Base Current — Continuous	I_B	8		Adc
— Peak(1)	I_{BM}	12		
Total Power Dissipation @ $T_C = 25^\circ\text{C}$ @ $T_C = 100^\circ\text{C}$ Derate above $T_C = 25^\circ\text{C}$	P_D	175 100 1	125 50 1	Watts W/°C
Operating and Storage Junction Temperature Range	T_J, T_{stg}	–65 to 200	–55 to 150	°C

THERMAL CHARACTERISTICS

Characteristic	Symbol	Max		Unit
Thermal Resistance, Junction to Case	$R_{\theta JC}$	1	1	°C/W
Lead Temperature for Soldering Purposes: 1/8" from Case for 5 Seconds	T_L	275		°C

(1) Pulse Test: Pulse Width = 5 μ s, Duty Cycle \leq 10%.

Designer's Data for "Worst Case" Conditions — The Designer's Data Sheet permits the design of most circuits entirely from the information presented. SOA Limit curves — representing boundaries on device characteristics — are given to facilitate "worst case" design.

Preferred devices are Motorola recommended choices for future use and best overall value.

Figure 15. Power Derating

SAFE OPERATING AREA INFORMATION

FORWARD BIAS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 13 is based on $T_C = 25^\circ\text{C}$; $T_J(\text{pk})$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when $T_C \geq 25^\circ\text{C}$. Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 13 may be found at any case temperature by using the appropriate curve on Figure 15.

$T_J(\text{pk})$ may be calculated from the data in Figure 16. At high case temperatures, thermal limitations will reduce the

power that can be handled to values less than the limitations imposed by second breakdown.

REVERSE BIAS

For inductive loads, high voltage and high current must be sustained simultaneously during turn-off, in most cases, with the base-to-emitter junction reverse biased. Under these conditions the collector voltage must be held to a safe level at or below a specific value of collector current. This can be accomplished by several means such as active clamping, RC snubbing, load line shaping, etc. The safe level for these devices is specified as Reverse Bias Safe Operating Area and represents the voltage current condition allowable during reverse biased turnoff. This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode. Figure 14 gives the RBSOA characteristics.
